Pre-lecture Problems for Lecture 6:
Integer Programming

Instructor: Ling-Chieh Kung
Department of Information Management
National Taiwan University

Note. The deadline of submitting the pre-lecture problem is **9:20 am, March 30, 2017**. Please submit a hard copy of your work in class. Late submissions will not be accepted. Each student must submit her/his individual work. Submit ONLY the problem that counts for grades.

1. (0 point) In this problem, we will use the branch-and-bound algorithm to solve the following IP

$$\max \quad 3x_1 + 5x_2$$
$$\text{s.t.} \quad x_1 + x_2 \leq 16$$
$$x_2 \leq 7.5$$
$$x_i \in \mathbb{Z}_+ \quad \forall i = 1, 2.$$

(a) Solve the linear relaxation of the given IP. Show that both x_1 and x_2 are fractional in the optimal solution.

(b) Branch on x_1 and continue until the IP is fully solved. Depict the branching tree.

(c) Instead of branch on x_1, branch on x_2 and continue until the IP is fully solved. Depict the branching tree. Compare the result with branching on x_1.

2. (0 point) Consider the following integer program

$$\max \quad x_1 + x_2$$
$$\text{s.t.} \quad 2x_1 + x_2 - 6 \leq M_1 z$$
$$x_1 + 2x_2 - 8 \leq M_2(1 - z)$$
$$x_1 \leq 10$$
$$x_2 \leq 10$$
$$x_i \geq 0 \quad \forall i = 1, 2$$
$$z \in \{0, 1\},$$

where M_1 and M_2 are parameters and x_1, x_2, and z are variables. The binary variable z is to select at least one constraint to be satisfied.

(a) What values of M_1 and M_2 can enable z to do the "at-least-one" selection?

(b) Depict the feasible region on the (x_1, x_2) plane. Then graphically solve the IP.
   Hint. The feasible region is nonconvex on the (x_1, x_2) plane. To solve this problem graphically, no branch-and-bound is needed.

3. (10 points) Use the branch-and-bound algorithm to solve the IP

$$\max \quad x_1 + 2x_2$$
$$\text{s.t.} \quad x_1 + x_2 \leq 6$$
$$5x_1 + 8x_2 \leq 30$$
$$x_i \in \mathbb{Z}_+ \quad \forall i = 1, 2.$$
