## 1 Biconnected Components

### Biconnected Components

- An undirected graph is *biconnected* if there are at least two vertex-disjoint paths from every vertex to every other vertex.
- A graph is *not* biconnected if and only if there is a vertex whose removal disconnects the graph. Such a vertex is called an *articulation point*.
- A *biconnected component* is a *maximal* subset of the edges such that its induced subgraph is biconnected (namely, there is no other subset that contains it and induces a biconnected graph).

### Biconnected Components (cont.)

### Biconnected Components (cont.)

**Lemma 1** (7.9). *Two distinct edges  $e$  and  $f$  belong to the same biconnected component if and only if there is a cycle containing both of them.*

**Lemma 2** (7.10). *Each edge belongs to exactly one biconnected component.*

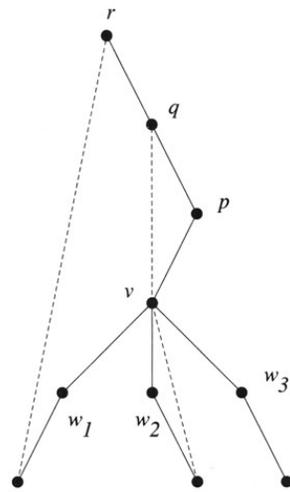

Biconnected Components (cont.)

Biconnected Components (cont.)

```

Algorithm Biconnected_Components( $G, v, n$ );
begin
  for every vertex  $w$  do  $w.DFS\_Number := 0$ ;
   $DFS\_N := n$ ;
   $BC(v)$ 
end
  
```

```

procedure BC(v);
begin
  v.DFS_Number := DFS_N;
  DFS_N := DFS_N - 1;
  insert v into Stack;
  v.high := v.DFS_Number;

```

#### Biconnected Components (cont.)

```

for all edges (v, w) do
  insert (v, w) into Stack;
  if w is not the parent of v then
    if w.DFS_Number = 0 then
      BC(w);
      if w.high ≤ v.DFS_Number then
        remove all edges and vertices
          from Stack until v is reached;
        insert v back into Stack;
        v.high := max(v.high, w.high)
      else
        v.high := max(v.high, w.DFS_Number)
    end
  end

```

#### Biconnected Components (cont.)

```

procedure BC(v);
begin
  v.DFS_Number := DFS_N;
  DFS_N := DFS_N - 1;
  v.high := v.DFS_Number;
  for all edges (v, w) do
    if w is not the parent of v then
      insert (v, w) into Stack;
      if w.DFS_Number = 0 then
        BC(w);
        if w.high ≤ v.DFS_Number then
          remove all edges from Stack
            until (v, w) is reached;
          v.high := max(v.high, w.high)
        else
          v.high := max(v.high, w.DFS_Number)
        end
    end
  end

```

### Even-Length Cycles

**Problem 3.** Given a connected undirected graph  $G = (V, E)$ , determine whether it contains a cycle of even length.

**Theorem 4.** Every biconnected graph that has more than one edge and is not merely an odd-length cycle contains an even-length cycle.

### Even-Length Cycles (cont.)

## 2 Strongly Connected Components

### Strongly Connected Components

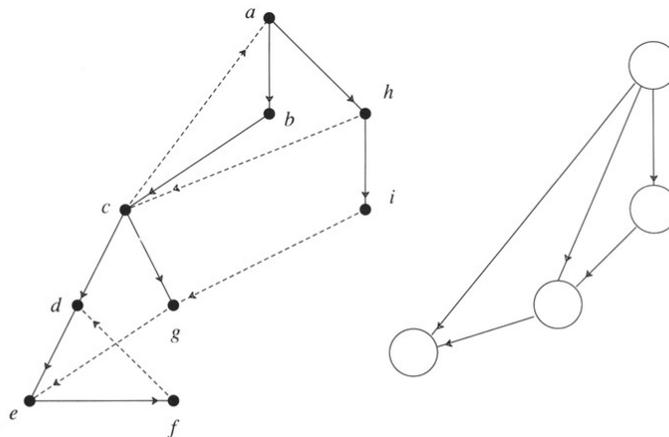

- A directed graph is *strongly connected* if there is a directed path from every vertex to every other vertex.
- A *strongly connected component* is a maximal subset of the vertices such that its induced subgraph is strongly connected (namely, there is no other subset that contains it and induces a strongly connected graph).

### Strongly Connected Components (cont.)

**Lemma 5** (7.11). *Two distinct vertices belong to the same strongly connected component if and only if there is a circuit containing both of them.*

**Lemma 6** (7.12). *Each vertex belongs to exactly one strongly connected component.*

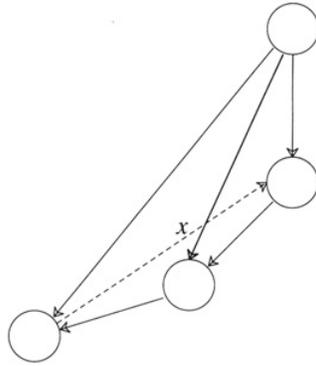

### Strongly Connected Components (cont.)

```

Algorithm Strongly_Connected_Components( $G, n$ );
begin
  for every vertex  $v$  of  $G$  do
     $v.DFS\_Number := 0$ ;
     $v.component := 0$ ;
   $Current\_Component := 0$ ;  $DFS\_N := n$ ;
  while  $v.DFS\_Number = 0$  for some  $v$  do

```

```

    SCC(v)
end

```

```

procedure SCC(v);
begin
    v.DFS_Number := DFS_N;
    DFS_N := DFS_N - 1;
    insert v into Stack;
    v.high := v.DFS_Number;

```

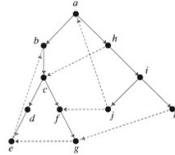

### Strongly Connected Components (cont.)

```

for all edges (v, w) do
    if w.DFS_Number = 0 then
        SCC(w);
        v.high := max(v.high, w.high)
    else if w.DFS_Number > v.DFS_Number
        and w.component = 0 then
        v.high := max(v.high, w.DFS_Number)
if v.high = v.DFS_Number then
    Current_Component := Current_Component + 1;
    repeat
        remove x from the top of Stack;
        x.component := Current_Component
    until x = v
end

```

## Odd-Length Cycles

**Problem 7.** Given a directed graph  $G = (V, E)$ , determine whether it contains a (directed) cycle of odd length.

- A cycle must reside completely within a strongly connected component (SCC), so we exam each SCC separately.
- Mark the nodes of an SCC with “even” or “odd” using DFS.
- If we have to mark a node that is already marked in the opposite, then we have found an odd-length cycle.

## 3 Network Flows

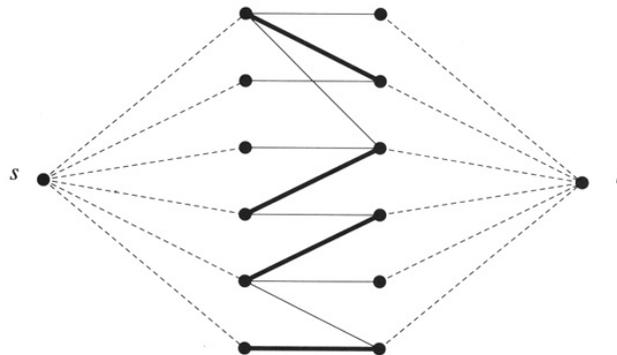

### Network Flows

- Consider a directed graph, or network,  $G = (V, E)$  with two distinguished vertices:  $s$  (the source) with indegree 0 and  $t$  (the sink) with outdegree 0.
- Each edge  $e$  in  $E$  has an associated positive weight  $c(e)$ , called the *capacity* of  $e$ .

### Network Flows (cont.)

- A **flow** is a function  $f$  on  $E$  that satisfies the following two conditions:
  1.  $0 \leq f(e) \leq c(e)$ .
  2.  $\sum_u f(u, v) = \sum_w f(v, w)$ , for all  $v \in V - \{s, t\}$ .
- The **network flow problem** is to maximize the flow  $f$  for a given network  $G$ .

### Network Flows (cont.)

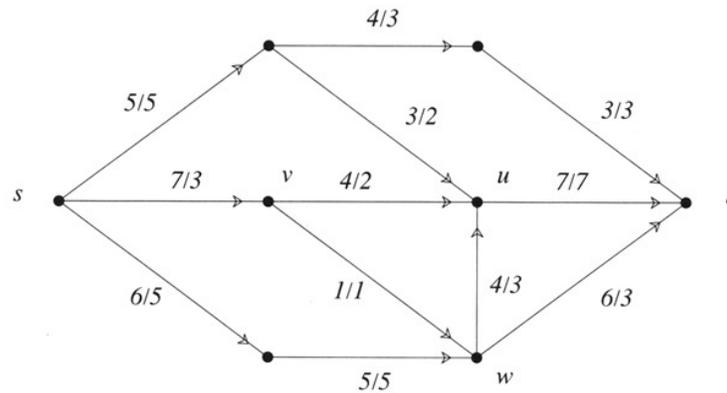

**Figure 7.39** Reducing bipartite matching to network flow (the directions of all the edges are from left to right).

Source: [Manber 1989].

## Augmenting Paths

- An **augmenting path** w.r.t. a given flow  $f$  (of a network  $G$ ) is a directed path from  $s$  to  $t$  consisting of edges from  $G$ , but not necessarily in the same direction; each of these edges  $(v, u)$  satisfies exactly one of:
  1.  $(v, u)$  is in the same direction as it is in  $G$ , and  $f(v, u) < c(v, u)$ . (*forward edge*)
  2.  $(v, u)$  is in the opposite direction in  $G$  (namely,  $(u, v) \in E$ ), and  $f(u, v) > 0$ . (*backward edge*)
- If there exists an augmenting path w.r.t. a flow  $f$  ( $f$  admits an augmenting path), then  $f$  is not maximum.

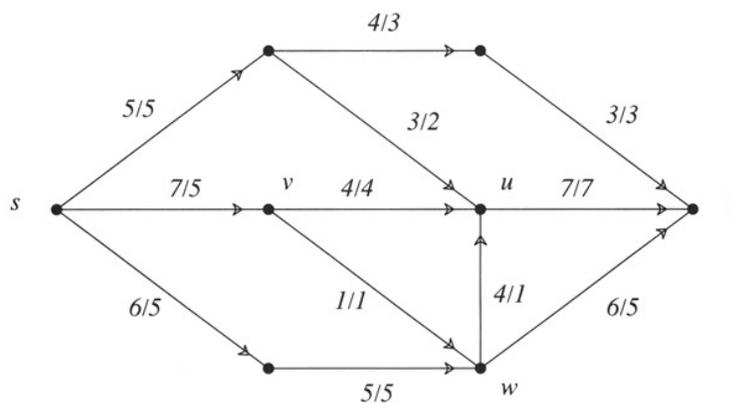

## Augmenting Paths (cont.)

**Figure 7.40** An example of a network with a (nonmaximum) flow.

Source: [Manber 1989].

## Augmenting Paths (cont.)

**Figure 7.41** The result of augmenting the flow of Fig. 7.40.

Source: [Manber 1989].

## Properties of Network Flows

**Theorem 8** (Augmenting-Path). *A flow  $f$  is maximum if and only if it admits no augmenting path.*

A *cut* is a set of edges that separate  $s$  from  $t$ , or more precisely a set of the form  $\{(v, w) \in E \mid v \in A \text{ and } w \in B\}$ , where  $B = V - A$  such that  $s \in A$  and  $t \in B$ .

**Theorem 9** (Max-Flow Min-Cut). *The value of a maximum flow in a network is equal to the minimum capacity of a cut.*

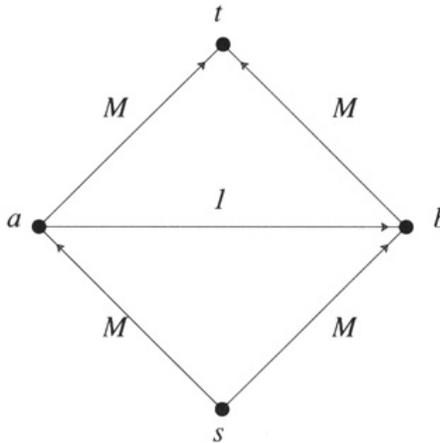

## Properties of Network Flows (cont.)

**Theorem 10** (Integral-Flow). *If the capacities of all edges in the network are integers, then there is a maximum flow whose value is an integer.*

## Residual Graphs

- The **residual graph** with respect to a network  $G = (V, E)$  and a flow  $f$  is the network  $R = (V, F)$ , where  $F$  consists of all forward and backward edges and their capacities are given as follows:
  1.  $c_R(v, w) = c(v, w) - f(v, w)$  if  $(v, w)$  is a forward edge and
  2.  $c_R(v, w) = f(w, v)$  if  $(v, w)$  is a backward edge.
- An augmenting path is thus a regular directed path from  $s$  to  $t$  in the residual graph.

## Residual Graphs (cont.)
