

Homework Assignment #1: An Exercise on Using Git

Due Date

10PM Tuesday, September 22, 2015.

Note

The main purpose of this little exercise is for you to get familiar with the distributed version control system Git. See separate instructions on the course website to create an account on the Git server for this course. An individual repository, initially containing a file `hw1.txt`, on the Git server will be created for you.

Task Description

Do the following:

1. Check out from your individual repository the file `hw1.txt`, update it (see instructions in the file), and check it in back to the same repository.

You would actually accomplish the above by first cloning the "remote" individual repository to your laptop or PC and then, when you are done with the updating in the local repository, pushing all updates back to the remote repository.

2. Create a new file `hw1a.txt`, write up one paragraph in the file describing the main difficulty/bottleneck (if any) in learning Git, and check it in to your individual repository on the server.
