イロト イヨト イヨト イヨト

Time Complexity

- Decidability of a problem merely indicates that the problem is computationally solvable *in principle*.
- It may not be solvable in practice if the solution requires an inordinate amount of time or memory.
- We shall introduce a way of measuring the time used to solve a problem.
- We then show how to classify problems according to the amount of time required.

・ ロ ト ・ 同 ト ・ 三 ト ・ 三 ト

Measuring Time Complexity

• Let
$$A = \{0^k 1^k \mid k \ge 0\}$$
.

- How much time does a single-tape TM need to decide A?
- \bigcirc A single-tape TM M_1 for A works as follows:
 - 1. Scan across the tape and *reject* if a 0 appears to the right of a 1.
 - 2. Repeat Stage 3 if both 0s and 1s remain on the tape.
 - 3. Scan across the tape, crossing off a single 0 and a single 1.
 - 4. If no 0s or 1s remain on the tape, accept; otherwise, reject.

・ ロ ト ・ 同 ト ・ 三 ト ・ 三 ト

Measuring Time Complexity

Measuring Time Complexity (cont.)

We shall compute the running time of an algorithm purely as a function of the length of the string representing the input.

Definition (7.1)

Let *M* be a deterministic TM that halts on all inputs. The **running time** or **time complexity** of *M* is the function $f : \mathcal{N} \longrightarrow \mathcal{N}$, where f(n) is the *maximum* number of steps that *M* uses on any input of length *n*. If f(n) is the running time of *M*, we say that *M* runs in time f(n) or that *M* is an f(n) time Turing machine.

Measuring Time Complexity (cont.)

We shall compute the running time of an algorithm purely as a function of the length of the string representing the input.

Definition (7.1)

Let *M* be a deterministic TM that halts on all inputs. The **running time** or **time complexity** of *M* is the function $f : \mathcal{N} \longrightarrow \mathcal{N}$, where f(n) is the *maximum* number of steps that *M* uses on any input of length *n*. If f(n) is the running time of *M*, we say that *M* runs in time f(n) or that *M* is an f(n) time Turing machine.

• We will mostly focus on *worst-case analysis*, measuring the longest running time of all inputs of a particular length.

Yih-Kuen Tsay (IM.NTU)

イロト 不得 トイラト イラト 一日

Asymptotic Analysis

- 😚 The exact running time of an algorithm is a complex expression.
- We seek to understand the running time of the algorithm when it is run on large inputs.
- We do so by considering only the highest-order term of the expression of its running time (discarding the coefficient of that term and any lower-order terms).
- For example, if $f(n) = 6n^3 + 2n^2 + 20n + 45$, we say that f is asymptotically at most n^3 .
- The asymptotic notation, or big-O notation, for describing this relationship is $f(n) = O(n^3)$.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Asymptotic Bounds

😚 Let \mathcal{R}^+ be the set of positive real numbers.

Definition (7.2)

Let f and g be two functions $f, g : \mathcal{N} \longrightarrow \mathcal{R}^+$. We say that f(n) = O(g(n)) if positive integers c and n_0 exist so that, for every integer $n \ge n_0$,

 $f(n) \leq cg(n).$

When f(n) = O(g(n)), we say that g(n) is an (asymptotic) upper bound for f(n).

Yih-Kuen Tsay (IM.NTU)

Time Complexity and NP-Completeness

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ののの

Asymptotic Bounds (cont.)

- Intuitively, f(n) = O(g(n)) means that f is less than or equal to g if we disregard differences up to a constant factor.
- Big-O notation gives a way to say that one function is asymptotically no more than another.
- Big-O notation can appear in arithmetic expressions such as $O(n^2) + O(n) \ (= O(n^2))$ and $2^{O(n)}$.
- Sounds of the form n^c , for c > 0, are called *polynomial bounds*.
- Sounds of the form 2^{n^c} , for c > 0, are called *exponential bounds*.

- ロ ト - (同 ト - (回 ト -) 回 ト -) 回

Asymptotic Bounds (cont.)

To say that one function is asymptotically *less than* another, we use small-o notation.

Definition (7.5)

Let f and g be two functions $f, g : \mathcal{N} \longrightarrow \mathcal{R}^+$. We say that f(n) = o(g(n)) if

$$\lim_{n\to\infty}\frac{f(n)}{g(n)}=0.$$

• For example, $\sqrt{n} = o(n)$ and $n \log n = o(n^2)$.

Yih-Kuen Tsay (IM.NTU)

Time Complexity and NP-Completeness

Analyzing Algorithms

- Source Consider the single-tape TM M_1 for deciding $\{0^k 1^k \mid k \ge 0\}$.
- Stage 1 takes $2n \ (= O(n))$ steps: *n* steps to scan the input and another *n* steps to reposition the head at the left-hand end of the tape.
- Each execution of Stage 3 takes 2n steps and at most n/2 such executions are required. So, Stages 2 and 3 take at most (n/2)2n (= O(n²)) steps.
- Stage 4 takes $n \ (= O(n))$ steps.

イロト 不得 トイラト イラト 二日

Complexity Classes

Definition (7.7)

Let $t : \mathcal{N} \longrightarrow \mathcal{N}$ be a function. Define the **time complexity class** TIME(t(n)) to be $\{L \mid L \text{ is a language decided by an } O(t(n))$ time Turing machine $\}$.

- $A (= \{0^k 1^k \mid k \ge 0\}) \in \text{TIME}(n^2)$, since M_1 decides A in time $O(n^2)$.
- Is there a machine that decides A asymptotically faster?
- In other words, is A in TIME(t(n)) for $t(n) = o(n^2)$?

Yih-Kuen Tsay (IM.NTU)

Time Complexity and NP-Completeness

Complexity Classes (cont.)

Below is a faster single-tape TM for deciding A $(= \{0^k 1^k \mid k \ge 0\}).$

- $M_2 =$ "On input string w:
 - 1. Same as Stage 1 of M_1 .
 - 2. Repeat Stages 3 and 4 if both 0s and 1s remain on the tape.
 - 3. If the total number of 0s and 1s remaining is odd, reject.
 - 4. Cross off every other 0 and then every other 1.
 - 5. If no 0s or 1s remain on the tape, accept; otherwise, reject."
- The running time of M_2 is $O(n \log n)$ and hence $A \in \text{TIME}(n \log n)$.

Complexity Classes (cont.)

- Selow is an even faster TM, which has two tapes, for deciding A (= {0^k1^k | k ≥ 0}).
- $M_3 =$ "On input string w:
 - 1. Same as Stage 1 of M_1 .
 - 2. Copy the 0s on Tape 1 onto Tape 2.
 - 3. Scan across the 1s on Tape 1 until the end of the input, crossing off a 0 on Tape 2 for each 1. If there are not enough 0s, *reject*.
 - If all the 0s have now been crossed off, *accept*; otherwise, *reject*."
- The running time of M_3 is O(n).
- This indicates that the complexity of A depends on the model of computation selected.

Complexity Relationships among Models

Theorem (7.8)

Let t(n) be a function, where $t(n) \ge n$. Then every t(n) time multitape Turing machine has an equivalent $O(t^2(n))$ time single-tape Turing machine.

- Let M be a k-tape TM running in t(n) time.
- A single-tape TM S simulating M requires O(t(n)) tape cells to store the current contents of M's tapes and the respective head positions.
- It takes O(t(n)) time for S to simulate each of M's t(n) steps.
- 📀 So, the running time of S is $t(n) imes O(t(n)) = O(t^2(n)).$

Polynomial Time

- For our purposes, polynomial differences in running time are considered to be small, whereas exponential differences are considered to be large.
- Exponential time algorithms typically arise when we solve problems by searching through a space of solutions, called *brute-force search*.
- All "reasonable" deterministic computational models are polynomially equivalent, i.e., any one of them can simulate another with a polynomial increase in running time.
- We shall focus on aspects of time complexity theory that are unaffected by polynomial differences in running time.

- ロ ト - (同 ト - (回 ト -) 回 ト -) 回

The Class P

Definition (7.12)

P is the class of languages that are decidable in *polynomial* time on a *deterministic* single-tape Turing machine. In other words,

$$\mathbf{P} = \bigcup_k \mathrm{TIME}(n^k)$$

P is invariant for all models of computing that are polynomially equivalent to the deterministic single-tape Turing machine.

P roughly corresponds to the class of problems that are "realistically solvable" on a computer.

Yih-Kuen Tsay (IM.NTU)

Time Complexity and NP-Completeness

Theory of Computing 2024 18 / 54

- ロ ト - (同 ト - (回 ト -) 回 ト -) 回

Analyzing Algorithms for P Problems

- Suppose that we have given a high-level description of a polynomial-time algorithm with stages. To analyze the algorithm,
 - 1. we first give a polynomial upper bound on the number of stages that the algorithm uses, and
 - 2. we then show that the individual stages can be implemented in polynomial time on a reasonable deterministic model.
- A "reasonable" encoding method for problems should be used, which allows for polynomial-time encoding and decoding of objects into natural internal representation or into other reasonable encodings.

Problems in P

• $PATH = \{ \langle G, s, t \rangle \mid G \text{ is a directed graph that has a directed path from s to } t \}.$

Theorem (7.14)

 $PATH \in P$.

• M = "On input $\langle G, s, t \rangle$:

- 1. Place a mark on node *s*.
- 2. Repeat Stage 3 until no additional nodes are marked.
- 3. Scan all the edges of G. If an edge (a, b) is found going from a marked node a to an unmarked node b, mark node b.
- 4. If t is marked, accept; otherwise, reject."

The Hamiltonian Path Problem

- A Hamiltonian path in a directed graph is a directed path that goes through each node exactly once.
- HAMPATH = { $\langle G, s, t \rangle | G$ is a directed graph with a Hamiltonian path from s to t}.
- We can easily obtain an exponential time algorithm for HAMPATH.
- No one knows whether HAMPATH is solvable in polynomial time.

The Class NP

Definition (7.18)

A verifier for a language A is an algorithm V, where

$$A = \{w \mid V \text{ accepts } \langle w, c \rangle \text{ for some string } c \}.$$

The information represented by the symbol c is called a *certificate*, or *proof*, of membership in A. A *polynomial-time verifier* runs in polynomial time in the length of w.

Definition (7.19)

NP is the class of *polynomially verifiable* languages, i.e., languages that have polynomial-time verifiers.

Yih-Kuen Tsay (IM.NTU)

Time Complexity and NP-Completeness

The Class NP (cont.)

Theorem (7.20)

A language is in NP iff it is decided by some nondeterministic polynomial time Turing machine.

- Let V be a verifier for $A \in NP$ that runs in time n^k . Construct a decider N for A as follows.
- N = "On input *w* of length *n*:
 - 1. Nondeterministically select string c of length n^k .
 - 2. Run V on input $\langle w, c \rangle$.
 - 3. If V accepts, *accept*; otherwise, *reject*."

Time Complexity and NP-Completeness

Theory of Computing 2024 29 / 54

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ののの

Analyzing Algorithms for NP Problems

- The class NP is insensitive to the choice of reasonable nondeterministic computational model.
- Like in the deterministic case, we use a high-level description to present a nondeterministic polynomial-time algorithm.
 - 1. Each stage of a nondeterministic polynomial-time algorithm must have an obvious implementation in polynomial time on a reasonable nondeterministic model.
 - 2. Every branch of its computation tree uses at most polynomially many stages.

ヘロト 不得下 イヨト イヨト 二日

- A clique in an undirected graph is a subgraph, wherein every two nodes are connected by an edge.
- A k-clique is a clique that contains k nodes.
- $CLIQUE = \{ \langle G, k \rangle \mid G \text{ is an undirected graph with a } k$ -clique $\}$.

Another Two NP-Complete Problems

Theorem

3SAT is NP-complete.

- The proof of the Cook-Levin theorem can be modified so that the Boolean formula involved is in conjunctive normal form.
- A CNF-formula can be converted in polynomial time to a 3CNF-formula (with a length polynomially bounded in the length of the CNF-formula).
- If a clause contains *I* literals $(a_1 \lor a_2 \lor \cdots \lor a_l)$, we can replace it with the l-2 clauses

$$(a_1 \lor a_2 \lor z_1) \land (\overline{z_1} \lor a_3 \lor z_2) \land (\overline{z_2} \lor a_4 \lor z_3) \land \\ \cdots \land (\overline{z_{l-4}} \lor a_{l-2} \lor z_{l-3}) \land (\overline{z_{l-3}} \lor a_{l-1} \lor a_l)$$

Another Two NP-Complete Problems (cont.)

Theorem

CLIQUE is NP-complete.

CLIQUE is in NP and 3SAT $\leq_{\rm P}$ CLIQUE.
