# The Standard Induction Principle

- Let T be a theorem that we want to prove and suppose that T includes a parameter n whose value can be any natural number.
- Here, natural numbers are positive integers, i.e., 1, 2, 3, ..., excluding 0.
- To prove *T*, it suffices to prove the following two conditions:
  - Solution T holds for n = 1. (Base case)
  - For every n > 1, if T holds for n 1, then T holds for n. (Inductive step)
- The assumption in the inductive step that T holds for n − 1 is called the *induction hypothesis*.

イロト イポト イヨト イヨト

# **A Starter**

# Theorem (2.1)

For all natural numbers x and n,  $x^n - 1$  is divisible by x - 1.

#### Proof.

(Note: try to follow the structure of this proof when you do a proof by induction.) The proof is by induction on n. Base case: x - 1 is trivially divisible by x - 1. Inductive step:  $x^n - 1 = x(x^{n-1} - 1) + (x - 1)$ .  $x^{n-1} - 1$  is divisible by x - 1 from the induction hypothesis and x - 1 is divisible by x - 1. Hence,  $x^n - 1$  is divisible by x - 1.

Note: *a* is divisible by *b* if there exists an integer *c* such that  $a = b \times c$ .

Yih-Kuen Tsay (IM.NTU)

Mathematical Induction

# Variants of Induction Principle

#### Theorem

If a statement P, with a parameter n, is true for n = 1, and if, for every  $n \ge 1$ , the truth of P for n implies its truth for n + 1, then P is true for all natural numbers.

# Theorem (Strong Induction)

If a statement P, with a parameter n, is true for n = 1, and if, for every n > 1, the truth of P for all natural numbers < n implies its truth for n, then P is true for all natural numbers.

#### Theorem

If a statement P, with a parameter n, is true for n = 1 and for n = 2, and if, for every n > 2, the truth of P for n - 2 implies its truth for n, then P is true for all natural numbers.

# **Design by Induction: First Glimpse**

#### Problem

Given two sorted arrays A[1..m] and B[1..n] of positive integers, find their smallest common element; returns 0 if no common element is found.

- Assume the elements of each array are in ascending order.
- Obvious solution: take one element at a time from A and find out if it is also in B (or the other way around).
- How efficient is this solution?
- 😚 Can we do better?

(日) (同) (三) (三)

# Design by Induction: First Glimpse (cont.)

- There are m + n elements to begin with.
- Can we pick out one element such that either (1) it is the element we look for or (2) it can be ruled out from subsequent searches?
- In the second case, we are left with the same problem but with m + n 1 elements?
- Idea: compare the current first elements of A and B.
  - 1. If they are equal, then we are done.
  - 2. The smaller one cannot be the smallest common element.

(日) (同) (三) (三)

# Design by Induction: First Glimpse (cont.)

Below is the complete solution:

# Algorithm

```
function SCE(A, m, B, n) : integer;
begin

if m = 0 or n = 0 then SCE := 0;

if A[1] = B[1] then

SCE := A[1];

else if A[1] < B[1] then

SCE := SCE(A[2..m], m - 1, B, n);

else SCE := SCE(A, m, B[2..n], n - 1);

end
```

# Proving vs. Computing

Theorem (2.2)

 $1+2+\cdots+n=\frac{n(n+1)}{2}.$ 

This can be easily proven by induction.

• Key steps: 
$$1 + 2 + \dots + n + (n + 1) = \frac{n(n+1)}{2} + (n + 1) = \frac{n^2 + n + 2n + 2}{2} = \frac{n^2 + 3n + 2}{2} = \frac{(n+1)(n+2)}{2}$$
.

Induction seems to be useful only if we already know the sum.

- What if we are asked to compute the sum of a series?
- Let's try  $8 + 13 + 18 + 23 + \dots + (3 + 5n)$ .

Yih-Kuen Tsay (IM.NTU)

# Proving vs. Computing (cont.)

- **Idea**: guess and then verify by an inductive proof!
- The sum should be of the form  $an^2 + bn + c$ .
- Solution By checking n = 1, 2, and 3, we get  $\frac{5}{2}n^2 + \frac{11}{2}n$ .
- S Verify this for all *n*, i.e., the following theorem, by induction.

#### Theorem (2.3)

 $8+13+18+23+\cdots+(3+5n)=\frac{5}{2}n^2+\frac{11}{2}n.$ 

Yih-Kuen Tsay (IM.NTU)

Mathematical Induction

Algorithms 2010 9 / 28

# Another Simple Example

#### Theorem (2.4)

If n is a natural number and 1 + x > 0, then  $(1 + x)^n \ge 1 + nx$ .

Below are the key steps:

$$\begin{array}{rl} (1+x)^{n+1} &= (1+x)(1+x)^n \\ & \{ \text{induction hypothesis and } 1+x > 0 \} \\ &\geq (1+x)(1+nx) \\ &= 1+(n+1)x+nx^2 \\ &\geq 1+(n+1)x \end{array}$$

The main point here is that we should be clear about how conditions listed in the theorem are used.

# **Counting Regions (cont.)**

# Theorem (2.5)

The number of regions in the plane formed by n lines in general position is  $\frac{n(n+1)}{2} + 1$ .

A set of lines are in **general position** if (1) no two lines are parallel and (2) no three lines intersect at a common point.

• We observe that 
$$\frac{n(n+1)}{2} = 1 + 2 + \dots + n$$
.

So, it suffices to prove the following:

#### Lemma

Adding one more line (the n-th line) to n-1 lines in general position in the plane increases the number of regions by n.

Yih-Kuen Tsay (IM.NTU)

Mathematical Induction

# **A Summation Problem**

#### Theorem

The sum of row n in the triangle is  $n^3$ .

Examine the difference between rows i + 1 and  $i \dots$ 

#### Lemma

The last number in row n + 1 is  $n^2 + 3n + 1$ .

# A Simple Inequality

# Theorem (2.7) $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^n} < 1$ , for all $n \ge 1$ .

• There are at least two ways to select *n* terms from n + 1 terms. 1.  $(\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^n}) + \frac{1}{2^{n+1}}$ . 2.  $\frac{1}{2} + (\frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^n} + \frac{1}{2^{n+1}})$ .

The second one leads to a successful inductive proof:

$$\frac{1}{2} + \left(\frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^n} + \frac{1}{2^{n+1}}\right)$$

$$= \frac{1}{2} + \frac{1}{2}\left(\frac{1}{2} + \frac{1}{4} + \dots + \frac{1}{2^{n-1}} + \frac{1}{2^n}\right)$$

$$< \frac{1}{2} + \frac{1}{2}$$

$$= 1$$

# Arithmetic vs. Geometric Mean

Theorem (2.13)

If 
$$x_1, x_2, \dots, x_n$$
 are all positive numbers, then  
 $(x_1x_2\cdots x_n)^{rac{1}{n}} \leq rac{x_1+x_2+\cdots+x_n}{n}.$ 

First use the standard induction to prove the case of powers of 2 and then use the reversed induction principle below to prove for all natural numbers.

#### Theorem (Reversed Induction Principle)

If a statement P, with a parameter n, is true for an infinite subset of the natural numbers, and if, for every n > 1, the truth of P for n implies its truth for n - 1, then P is true for all natural numbers.
