### 1 Data Compression

#### **Data Compression**

**Problem 1.** Given a text (a sequence of characters), find an encoding for the characters that satisfies the prefix constraint and that minimizes the total number of bits needed to encode the text.

The *prefix constraint* states that the prefixes of an encoding of one character must not be equal to a complete encoding of another character.

Denote the characters by  $c_1, c_2, \dots, c_n$  and their frequencies by  $f_1, f_2, \dots, f_n$ . Given an encoding E in which a bit string  $s_i$  represents  $c_i$ , the length (number of bits) of the text encoded by using E is  $\sum_{i=1}^n |s_i| \cdot f_i$ .

#### A Code Tree

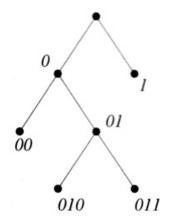

Figure 6.17 The tree representation of encoding.

#### A Huffman Tree

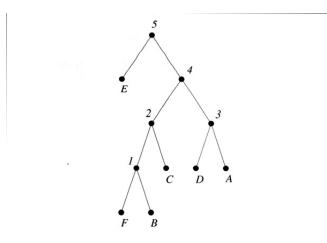

Figure 6.19 The Huffman tree for example 6.1.

Source: [Manber 1989].

#### **Huffman Encoding**

```
Algorithm Huffman_Encoding (S, f);
insert all characters into a heap H
according to their frequencies;
```

while H not empty do
if H contains only one character X then
make X the root of T
else
delete X and Y with lowest frequencies;
from H;
create Z with a frequency equal to the
sum of the frequencies of X and Y;
insert Z into H;
make X and Y children of Z in T

## 2 String Matching

#### **String Matching**

**Problem 2.** Given two strings  $A (= a_1 a_2 \cdots a_n)$  and  $B (= b_1 b_2 \cdots b_m)$ , find the first occurrence (if any) of B in A. In other words, find the smallest k such that, for all  $i, 1 \leq i \leq m$ , we have  $a_{k-1+i} = b_i$ .

A substring of a string A is a consecutive sequence of characters  $a_i a_{i+1} \cdots a_j$  from A.

#### Straightforward String Matching

A = xyxxyxyxyxyxyxyxyxyxxx. B = xyxyyxyxyxxx. 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 1:  $x y x y \cdot \cdot \cdot$ x · · · 2: ху... 3: 4: х у х у у · · · x · · · 5: x y x y y x y x y x x x · · · 6: 7: 8:  $x y x \cdot \cdot \cdot$  $x \cdot \cdot \cdot$ 9:  $x \cdot \cdot \cdot$ 10: 11: *x y x y y · · ·* 12:  $x \cdot \cdot \cdot$ 13: xyxyyxyxyxx

#### The Values of next

<i>i</i> =	1	2	3	4	5	6	7	8	9	10	11
<i>B</i> =	x	у	x	у	у	x	у	x	у	x	x
next =	-1	0	0	1	2	0	1	2	3	4	3

Figure 6.22 The values of next.

Source: [Manber 1989].

#### The KMP Algorithm

Algorithm String\_Match (A, n, B, m); begin j := 1; i := 1; Start := 0;while Start = 0 and  $i \le n$  do if B[j] = A[i] then j := j + 1; i := i + 1else j := next[j] + 1;if j = 0 then j := 1; i := i + 1;if j = m + 1 then Start := i - mand

 $\mathbf{end}$ 

The KMP Algorithm (cont.)

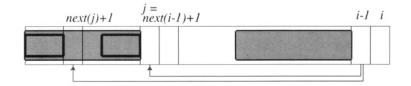

Figure 6.24 Computing next(i).

Source: [Manber 1989].

The KMP Algorithm (cont.)

```
Algorithm Compute_Next (B, m);
begin
next[1] := -1; next[2] := 0;
for i := 3 to m do
j := next[i - 1] + 1;
while b_{i-1} \neq b_j and j > 0 do
j := next[j] + 1;
next[i] := j
```

end

## 3 String Editing

#### String Editing

**Problem 3.** Given two strings  $A \ (= a_1 a_2 \cdots a_n)$  and  $B \ (= b_1 b_2 \cdots b_m)$ , find the minimum number of changes required to change A character by character such that it becomes equal to B.

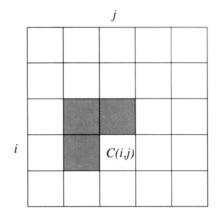

Three types of changes (or edit steps) allowed: (1) insert, (2) delete, and (3) replace.

#### String Editing (cont.)

Let C(i, j) denote the minimum cost of changing A(i) to B(j), where  $A(i) = a_1 a_2 \cdots a_i$  and  $B(j) = b_1 b_2 \cdots b_j$ .

$$C(i,j) = \min \begin{cases} C(i-1,j) + 1 & (\text{deleting } a_i) \\ C(i,j-1) + 1 & (\text{inserting } b_j) \\ C(i-1,j-1) + 1 & (a_i \to b_j) \\ C(i-1,j-1) & (a_i = b_j) \end{cases}$$

String Editing (cont.)
