### Graphs

- A graph consists of a set of vertices (or nodes) and a set of edges (or links, each normally connecting two vertices).
- A graph is commonly denoted as G(V, E), where
  - 🔅 G is the name of the graph,
  - V is the set of vertices, and
  - E is the set of edges.

# **Eulerian Graphs**

#### Problem

Given an undirected connected graph G = (V, E) such that all the vertices have even degrees, find a circuit P such that each edge of E appears in P exactly once.

The circuit *P* in the problem statement is called an *Eulerian circuit*.

#### Theorem

An undirected connected graph has an Eulerian circuit if and only if all of its vertices have even degrees.

#### **Depth-First Search**

# The DFS Tree (cont.)

#### Lemma (7.2)

For an undirected graph G = (V, E), every edge  $e \in E$  either belongs to the DFS tree T, or connects two vertices of G, one of which is the ancestor of the other in T.

For undirected graphs, DFS avoids cross edges.

#### Lemma (7.3)

For a directed graph G = (V, E), if (v, w) is an edge in E such that  $v.DFS_Number < w.DFS_Number$ , then w is a descendant of v in the DFS tree T.

For directed graphs, cross edges must go "from right to left".

Yih-Kuen Tsay (IM.NTU)

Basic Graph Algorithms

#### **Directed Cycles**

#### Problem

Given a directed graph G = (V, E), determine whether it contains a (directed) cycle.

## Lemma (7.4)

*G* contains a directed cycle if and only if *G* contains a back edge (relative to the DFS tree).

## **Minimum-Weight Spanning Trees**

#### Problem

Given an undirected connected weighted graph G = (V, E), find a spanning tree T of G of minimum weight.

#### Theorem

Let  $V_1$  and  $V_2$  be a partition of V and  $E(V_1, V_2)$  be the set of edges connecting nodes in  $V_1$  to nodes in  $V_2$ . The edge with the minimum weight in  $E(V_1, V_2)$  must be in the minimum-cost spanning tree of G.

If cost(u, v) is the smallest among  $E(V_1, V_2)$ , then  $\{u, v\}$  must be in the minimum spanning tree.
