## Homework Assignment #4

## Note

This assignment is due 2:10PM Tuesday, April 2, 2013. Please write or type your answers on A4 (or similar size) paper. Drop your homework by the due time in Yih-Kuen Tsay's mail box on the first floor of Management College Building II. Late submission will be penalized by 20% for each working day overdue. You may discuss the problems with others, but copying answers is strictly forbidden.

## **Problems**

There are five problems in this assignment, each accounting for 20 points. (Note: problems marked with "(X.XX)" are taken from [Manber 1989] with probable adaptation.)

- 1. (5.3) Consider algorithm Mapping (see notes/slides). Is it possible that the set S will become empty at the end of the algorithm? Show an example, or prove that it cannot happen.
- 2. (5.8; corrected) In algorithm Knapsack, we first checked whether the ith item is unnecessary (by checking P[i-1,j]). If there is a solution with the i-1 items, we take this solution. We can also make the opposite choice, which is to take the solution with the ith item if it exists (i.e., check  $P[i-1,j-k_i]$  first). Which version do you think will have a better performance? Redraw Fig. 5.11 (see slides) to reflect this choice.
- 3. (5.17) The Knapsack Problem that we discussed in class is defined as follows: Given a set S of n items, where the ith item has an integer size S[i], and an integer K, find a subset of the items whose sizes sum to exactly K or determine that no such subset exists.
  - We have described in class an algorithm to solve the problem. Modify the algorithm to solve a variation of the knapsack problem where each item has an *unlimited* supply. In your algorithm, please change the type of P[i,k]. belong into integer and use it to record the number of copies of item i needed.
- 4. (5.20) Let  $x_1, x_2, \ldots, x_n$  be a set of integers, and let  $S = \sum_{i=1}^n x_i$ . Design an algorithm to partition the set into two subsets of equal sum, or determine that it is impossible to do so. The algorithm should run in time O(nS).
- 5. (5.22) In the **towers of Hanoi** puzzle, there are three pegs A, B, and C, with n (generalizing the original eight) disks of different sizes stacked in decreasing order on peg A. The objective is to transfer all the disks on peg A to peg B, moving one disk at a time (from one peg to one of the other two) and never having a larger disk stacked upon a smaller one.
  - (a) Give an algorithm to solve the puzzle. Explain how induction works here.
  - (b) Compute the total number of moves in the algorithm. Show the details of your calculation.
