Algorithms 2014: NP-Completeness

(Based on [Manber 1989])

Yih-Kuen Tsay

1 P vs. NP

P vs. NP

- P denotes the class of all problems that can be solved by deterministic algorithms in polynomial time.
- NP denotes the class of all problems that can be solved by *nondeterministic* algorithms in *polynomial* time
- A nondeterministic algorithm, when faced with a choice of several options, has the power to guess the right one (if there is any).
- We will focus on *decision* problems, whose answer is either yes or no.

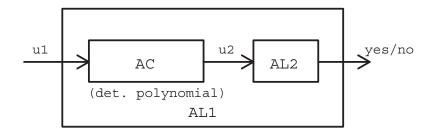

2 Polynomial-Time Reductions

Decision as Language Recognition

- A decision problem can be viewed as a language-recognition problem.
- Let U be the set of all possible inputs to the decision problem and $L \subseteq U$ be the set of all inputs for which the answer to the problem is yes.
- We call L the *language* corresponding to the problem.
- The decision problem is to recognize whether a given input belongs to L.

Polynomial-Time Reductions

- Let L_1 and L_2 be two languages from the input spaces U_1 and U_2 .
- We say that L_1 is polynomially reducible to L_2 if there exists a conversion algorithm AC satisfying the following conditions:
 - 1. AC runs in polynomial time (deterministically).
 - 2. $u_1 \in L_1$ if and only if $AC(u_1) = u_2 \in L_2$.

Polynomial-Time Reductions (cont.)

Theorem 1 (11.1). If L_1 is polynomially reducible to L_2 and there is a polynomial-time algorithm for L_2 , then there is a polynomial-time algorithm for L_1 .

Theorem 2 (11.2: transitivity). If L_1 is polynomially reducible to L_2 and L_2 is polynomially reducible to L_3 , then L_1 is polynomially reducible to L_3 .

3 NP-Completeness

NP-Completeness

- A problem X is called an **NP-hard** problem if every problem in NP is polynomially reducible to X.
- A problem X is called an **NP-complete** problem if (1) X belongs to NP, and (2) X is NP-hard. **Lemma 3** (11.3). A problem X is an NP-complete problem if (1) X belongs to NP, and (2') Y is polynomially reducible to X, for some NP-complete problem Y.
- If there exists an efficient (polynomial-time) algorithm for any NP-complete problem, then there exist efficient algorithms for all NP-complete (and hence all NP) problems.

4 The SAT Problem

The Satisfiability Problem (SAT)

Problem 4. Given a Boolean expression in conjunctive normal form, determine whether it is satisfiable.

- A Boolean expression is in *conjunctive normal form* (CNF) if it is the product of several sums, e.g., $(x + y + \bar{z}) \cdot (\bar{x} + y + z) \cdot (\bar{x} + \bar{y} + \bar{z})$.
- A Boolean expression is said to be *satisfiable* if there exists an assignment of 0s and 1s to its variables such that the value of the expression is 1.

SAT (cont.)

Theorem 5 (Cook's Theorem). The SAT problem is NP-complete.

- This is our starting point for showing the NP-completeness of some other problems.
- Their NP-hardness will be proved by reduction directly or indirectly from SAT.

NP-Complete Problems

5 Vertex Cover

Vertex Cover

Problem 6. Given an undirected graph G = (V, E) and an integer k, determine whether G has a vertex cover containing $\leq k$ vertices.

A vertex cover of G is a set of vertices such that every edge in G is incident to at least one of these vertices.

Theorem 7 (11.4). The vertex-cover problem is NP-complete.

By reduction from the clique problem.

6 Dominating Set

Dominating Set

Problem 8. Given an undirected graph G = (V, E) and an integer k, determine whether G has a dominating set containing $\leq k$ vertices.

A dominating set D is a set of vertices such that every vertex of G is either in D or is adjacent to some vertex in D.

Theorem 9 (11.5). The dominating-set problem is NP-complete.

By reduction from the vertex-cover problem.

Dominating Set (cont.)

7 3SAT

3SAT

Problem 10. Given a Boolean expression in CNF such that each clause contains exactly three variables, determine whether it is satisfiable.

Theorem 11 (11.6). The 3SAT problem is NP-complete.

By reduction from the regular SAT problem.

8 Clique

Clique

Problem 12. Given an undirected graph G = (V, E) and an integer k, determine whether G contains a clique of $size \geq k$.

A clique C is a subgraph of G such that all vertices in C are adjacent to all other vertices in C.

Theorem 13 (11.7). The clique problem is NP-complete.

By reduction from the SAT problem.

Clique (cont.)

9 3-Coloring

3-Coloring

Problem 14. Given an undirected graph G = (V, E), determine whether G can be colored with three colors.

Theorem 15 (11.8). The 3-coloring problem is NP-complete.

By reduction from the 3SAT problem.

3-Coloring (cont.)

10 More NP-Complete Problems

More NP-Complete Problems

- Independent set: An independent set in an undirected graph is a set of vertices no two of which are adjacent. The problem is to determine, given a graph G and an integer k, whether G contains an independent set with $\geq k$ vertices.
- Hamiltonian cycle: A Hamiltonian cycle in a graph is a (simple) cycle that contains each vertex exactly once. The problem is to determine whether a given graph contains a Hamiltonian cycle.

More NP-Complete Problems (cont.)

- Travelling salesman: The input includes a set of cities, the distances between all pairs of cities, and a number D. The problem is to determine whether there exists a (travelling-salesman) tour of all the cities having total length $\leq D$.
- Partition: The input is a set X where each element $x \in X$ has an associated size s(x). The problem is to determine whether it is possible to partition the set into two subsets with exactly the same total size.

More NP-Complete Problems (cont.)

- Knapsack: The input is a set X, where each element $x \in X$ has an associated size s(x) and value v(x), and two other numbers S and V. The problem is to determine whether there is a subset $B \subseteq X$ whose total size is $\leq S$ and whose total value is $\geq V$.
- Bin packing: The input is a set of numbers $\{a_1, a_2, \dots, a_n\}$ and two other numbers b and k. The problem is to determine whether the set can be partition into k subsets such that the sum of numbers in each subset is $\leq b$.
