Introduction

- It is not necessary to design the steps required to solve a problem from scratch.
- 😚 It is sufficient to guarantee the following:
 - 1. It is possible to solve one small instance or a few small instances of the problem. (base case)
 - 2. A solution to every problem/instance can be constructed from solutions to smaller problems/instances. (inductive step)

< ロ > < 同 > < 三 > < 三

Evaluating Polynomials

Problem

Given a sequence of real numbers a_n , a_{n-1} , \cdots , a_1 , a_0 , and a real number x, compute the value of the polynomial

$$P_n(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0.$$

Yih-Kuen Tsay (IM.NTU)

Evaluating Polynomials

Problem

Given a sequence of real numbers a_n , a_{n-1} , \cdots , a_1 , a_0 , and a real number x, compute the value of the polynomial

$$P_n(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0.$$

Motivation: different approaches to the inductive step may result in algorithms of very different time complexities.

Yih-Kuen Tsay (IM.NTU)

- Let $P_{n-1}(x) = a_{n-1}x^{n-1} + \cdots + a_1x + a_0$.
- Induction hypothesis (first attempt) We know how to evaluate a polynomial represented by the input a_{n-1}, ..., a₁, a₀, at the point x, i.e., we know how to compute P_{n-1}(x).
 P_n(x) = a_nxⁿ + P_{n-1}(x).

(日) (周) (三) (三) (三) (000

Induction hypothesis (second attempt) We know how to compute P_{n-1}(x), and we know how to compute xⁿ⁻¹.

•
$$P_n(x) = a_n x(x^{n-1}) + P_{n-1}(x).$$

• Let
$$P'_{n-1}(x) = a_n x^{n-1} + a_{n-1} x^{n-2} + \dots + a_1$$
.

Induction hypothesis (final attempt) We know how to evaluate a polynomial represented by the coefficients a_n, a_{n-1}, ..., a₁, at the point x, i.e., we know how to compute P'_{n-1}(x).

•
$$P_n(x) = P'_n(x) = P'_{n-1}(x) \cdot x + a_0.$$

Yih-Kuen Tsay (IM.NTU)

$$\left\{ egin{array}{l} P_0'(x)=a_n \ \\ P_i'(x)=P_{i-1}'(x)\cdot x+a_{n-i}, \ ext{for} \ 1\leq i\leq n \end{array}
ight.$$

Maximal Induced Subgraph

Problem

Given an undirected graph G = (V, E) and an integer k, find an induced subgraph H = (U, F) of G of maximum size such that all vertices of H have degree $\geq k$ (in H), or conclude that no such induced subgraph exists.

Maximal Induced Subgraph

Problem

Given an undirected graph G = (V, E) and an integer k, find an induced subgraph H = (U, F) of G of maximum size such that all vertices of H have degree $\geq k$ (in H), or conclude that no such induced subgraph exists.

Design Idea: in the inductive step, we try to remove one vertex (that cannot possibly be part of the solution) to get a smaller instance.

One-to-One Mapping

Problem

Given a finite set A and a mapping f from A to itself, find a subset $S \subseteq A$ with the maximum number of elements, such that (1) the function f maps every element of S to another element of S (i.e., f maps S into itself), and (2) no two elements of S are mapped to the same element (i.e., f is one-to-one when restricted to S).

One-to-One Mapping

Problem

Given a finite set A and a mapping f from A to itself, find a subset $S \subseteq A$ with the maximum number of elements, such that (1) the function f maps every element of S to another element of S (i.e., f maps S into itself), and (2) no two elements of S are mapped to the same element (i.e., f is one-to-one when restricted to S).

Design Idea: similar to the previous problem; in the inductive step, we try to remove one element (that cannot possibly be part of the solution) to get a smaller instance.

Celebrity

Problem

Given an $n \times n$ adjacency matrix, determine whether there exists an i (the "celebrity") such that all the entries in the i-th column (except for the ii-th entry) are 1, and all the entries in the i-th row (except for the ii-th entry) are 0.

Note: A celebrity corresponds to a sink of the directed graph.

Note: Every directed graph has at most one sink.
