#### Web Application Development and Patterns

1

#### Jim Yu

IBM China Development Lab Greater China Group

### Web Characteristics

2

- Web is originally designed for documents instead of applications
  - Request-response model
    - Client (browser) initiates the request and server sends the response accordingly
    - No server push
  - Whole-page retrieval
    - The whole page is refreshed after the response is sent to the client
  - Stateless

#### Web as an Application Platform

#### Enabling technologies

- HTTP Cookie to remember user "states"
- "server pages" such as ASP, PHP, JSP to generate dynamic contents
- Client-side scripting (Javascript) or clientside applets (Flash, etc.) to enhance client richness
- Often needs to access or integrate with other systems

#### Database, LDAP, another web application, etc

Software Development Methods, Fall 2010

Web Application Design Patterns [2010/09/30]

### A Simple Web Application

# Intertwined HTML markup and application logic

```
<% // application logic to handle the submitted request %>
```

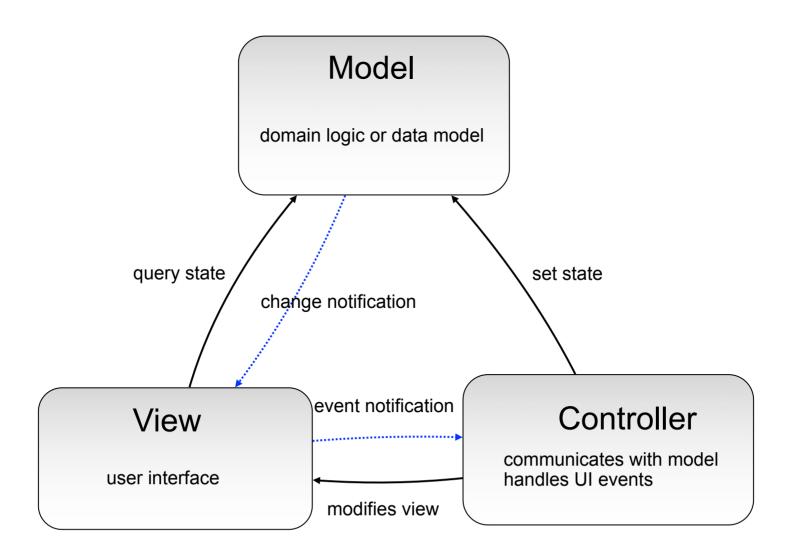

```
<form action="/some/web/page.jsp" method="post">
User id: <input type="text" name="userid"
value="<% request.getParameter("userid") %>">
Password: <input type="password" name="password">
<% if (...) { /* if some condition is met */ %>
<!-- some optional item is displayed here -->
<% } /* end of optional item */ %>
<input type="submit" value="submit"
</form>
```

#### Hard to maintain for large applications

### MVC Model 2

6

A Web adaptation of MVC
 An MVC Model 2 impl. using Servlet/JSP:

#### Web Mimicking Desktop Applications

- Client enhancements to make web applications richer
  - Asynchronous Javascript and XML (AJAX)
    - Asynchronous request/response with the server
      - No blocking of the client during request processing
      - Partial update of the web screen
  - Rich Internet Application (RIA) using Adobe Flash platform

#### Web Mimicking Desktop Applications

- Component-based web development:
  - Hides the underlying HTTP/HTML nature of web applications
  - Provide desktop-like development experience
    - Web widgets/components
    - Event notifications
  - Often provided by web application frameworks

### Web Frameworks

#### Software frameworks

- Skeleton for applications
- Common code provides generic functionality
- User-provided code implements specific functionality specific to user's application

#### Web application framework

- For developing dynamic web sites, web applications or web services
- Providing functionalities common in web development such as session management, database access, templating

Software Development Methods, Fall 2010

Web Application Design Patterns [2010/09/30]

### Web Framework Features

#### Security

Authentication and authorization

#### Database access

- connection management, database schema migration, etc.
- Object-relational mapping
- URL mapping

maps "cryptic" URL to more friendly forms

/display.php?category=Book&item=1 mapped as /display/Book/1

### Web Framework Features

#### Templating system

- For generating dynamic HTML content on the server side
- E.g. JSP, PHP
- Caching
  - Cache of generated web documents for better performance
- - Makes web application more responsive
  - Web frameworks ease the use of AJAX

### Web Framework Features

#### Automatic configuration

- E.g. Ruby on Rails: the DRY (Don't Repeat Yourself) principle
- E.g. Generating model objects (at runtime) from database schema

#### Web services

For creating web services or mapping objects to web services easily

Internationalization and localization

#### Some Popular Web Frameworks

- Zend framework (PHP)
- Ruby on Rails (Ruby)
- Google Web Toolkit (Java and Javascript)
   ASP.NET
- Java EE platform
- Flex (Actionscript and XML)
- And lots more

Software Development Methods, Fall 2010

### Java EE Design Patterns

- 14
- Java Enterprise Edition (Java EE, formerly J2EE) is a platform for developing server– centric enterprise applications
  - Including Web, database, enterprise business component, etc.
- Java EE design patterns provides best practice and common solution to recurring problems in using Java EE
  - Some are Java EE-specific, while others apply to web/database development on other platforms

### **Intercepting Filter**

Provide pluggable components to preprocess and postprocess Web requests and responses

Software Development Methods, Fall 2010

Web Application Design Patterns [2010/09/30]

#### Problem

- We often have to preprocess and postprocess Web requests and responses for:
   Client authenticated?
  - Client authorized to access the resource?
  - Trusted client IP address?
  - Requirement for browser capabilities (Flash player, JVM, audio/video player, etc.)
  - Client encoding?
- They are often shared services
- Request rejection or content manipulation needed Software Development Methods, Fall 2010
  Web Application Design Patterns [2010/09/30]

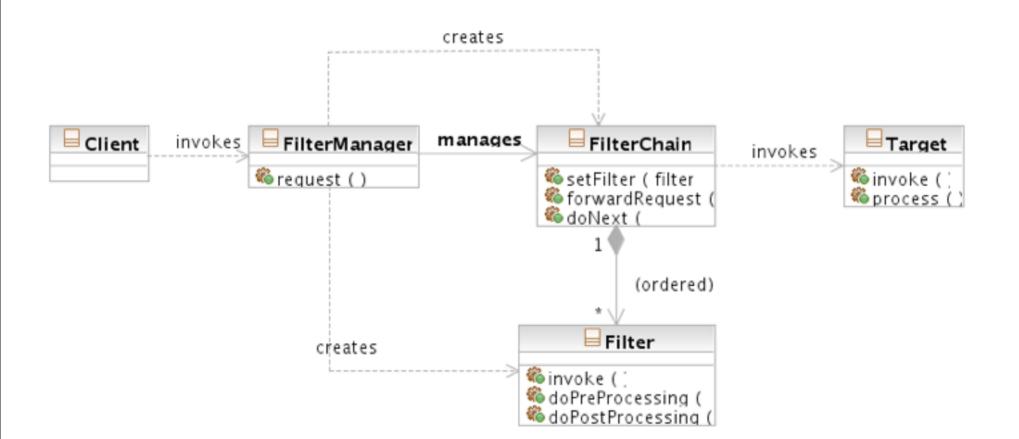

#### Solution

#### Decorator pattern

- Standard and pluggable filters to process common/shared services
  - Independent of the main application logic
- Configured declaratively
  - Mapping from some URLs to a filter chain (of a set of filters)

### Class Diagram

18

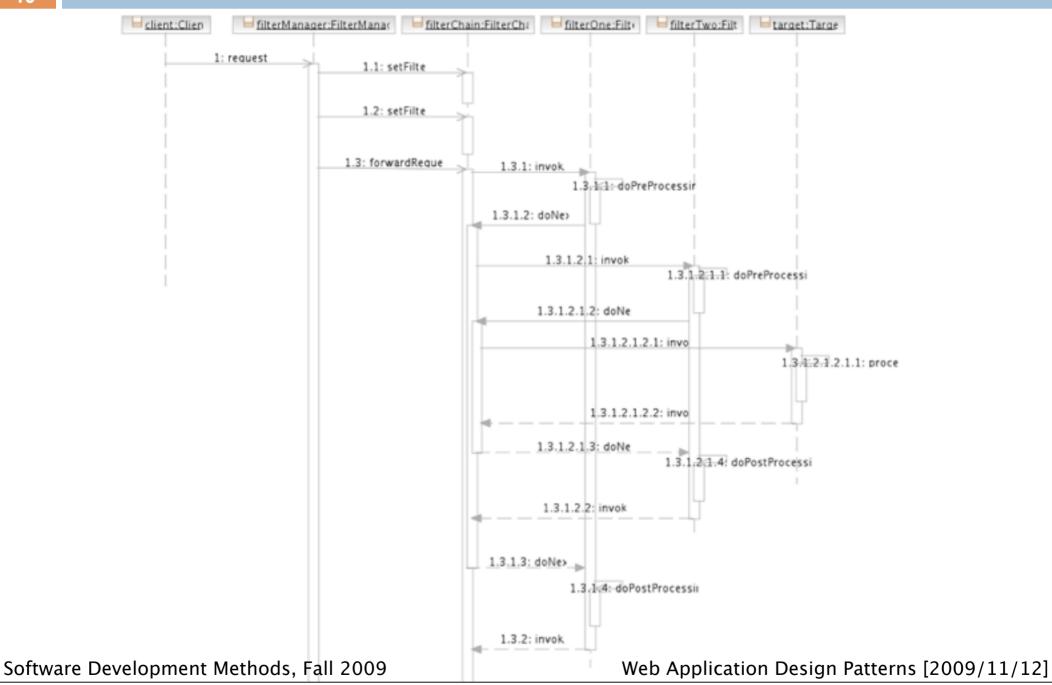

Software Development Methods, Fall 2010

Web Application Design Patterns [2010/09/30]

### Sequence Diagram

#### Consequences

- Centralizes control with loosely coupled handlers
- Improves reusability
- Declarative and flexible configuration
- Information sharing (between filters) is inefficient

#### **Composite View**

Compose the final view with atomic subviews dynamically

Software Development Methods, Fall 2010

Web Application Design Patterns [2010/09/30]

#### Problem

- Web views often have common visual components
  - Header, footer
  - Logo
  - Navigation toolbar, menu
- Statically embed them in each view is error prone and creates maintenance problems

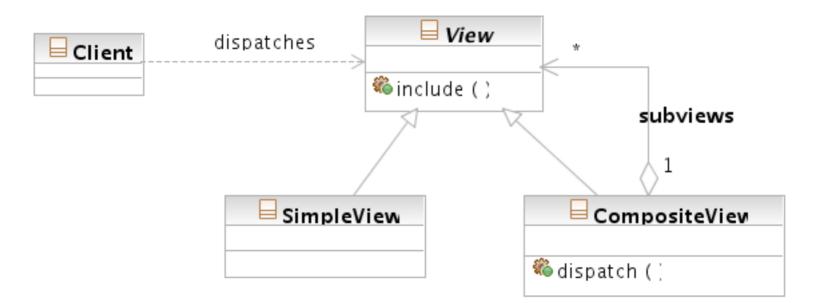

#### Solution

#### Composite Pattern

- Composite views composed of atomic subviews
- Composite view to include composite views or atomic subviews dynamically
- Layout can be managed independently of the content

#### Class Diagram

Software Development Methods, Fall 2010

Web Application Design Patterns [2010/09/30]

### Sequence Diagram

25

Software Development Methods, Fall 2010

Web Application Design Patterns [2010/09/30]

### Consequences

- Improves modularity and reuse
- Enhances flexibility
- Enhances maintainability and manageability
- Reduces manageability
  - e.g. when subviews generates unbalanced html tags and make the final output invalid HTML page
- Performance impact

#### Data Access Object

Abstracts and encapsulates all access to the data source

Software Development Methods, Fall 2010

Web Application Design Patterns [2010/09/30]

#### Problem

- Variety in how domain data are accessed
  - Persistent data from relational database, object-oriented database, XML database, LDAP, Flat files, etc.
    - Different APIs
  - Data from another system
    - Raw TCP socket, web service, etc.
- Some data access methods have constraints
  - e.g. connection number limit
- Hardcode data access API is inflexible

Software Development Methods, Fall 2010

Web Application Design Patterns [2010/09/30]

#### Solution

#### Adapter Pattern

- Encapsulate all access to the data source in the Data Access Object (DAO)
- DAO provides a simplified and consistent API to hides data access details from the caller
- Change underlying data source without affecting the DAO user

just change the concrete adapter

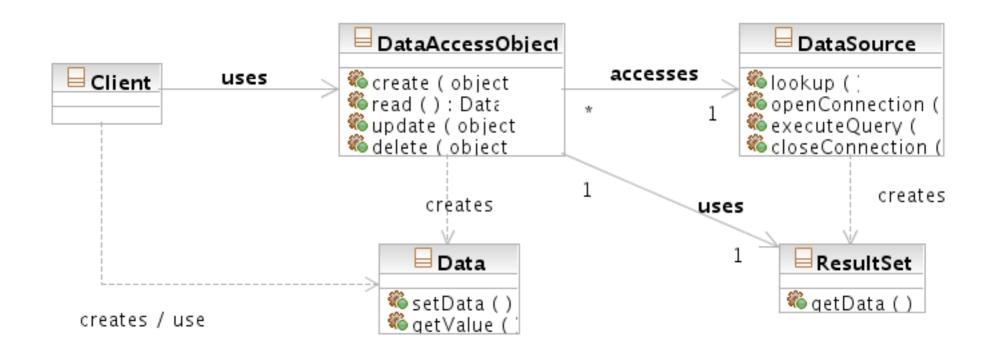

Easy to unit test with mock DAO impl.

Software Development Methods, Fall 2010

Software Development Methods, Fall 2010

Web Application Design Patterns [2010/09/30]

### Sequence Diagram

Software Development Methods, Fall 2009

Web Application Design Patterns [2009/11/12]

#### Consequences

- Enables transparency
- Enables easier migration
- Reduces code complexity in business objects
- Centralizes all data access into a separate layer
- Adds extra layer
