# An Axiomatic View of Programs

- The properties of a program can, in principle, be found out from its text by means of purely *deductive reasoning*.
- The deductive reasoning involves the application of valid inference rules to a set of valid axioms.
- The choice of axioms will depend on the choice of programming languages.
- We shall introduce such an axiomatic approach, called the *Hoare logic*, to program correctness.

イロト 不得下 イヨト イヨト

# Assertions

- When executed, a program will evolve through different states, which are essentially a mapping of the program variables to values in their respective domains.
- To reason about correctness of a program, we inevitably need to talk about its states.
- An *assertion* is a precise statement about the state of a program.
- Most interesting assertions can be expressed in a *first-order* language.

イロト 不得下 イヨト イヨト

- The behavior of a "structured" (single-entry/single-exit) program statement can be characterized by attaching assertions at the entry and the exit of the statement.
- For a statement S, this is conveniently expressed as a so-called *Hoare triple*, denoted  $\{P\} S \{Q\}$ , where
  - P is called the pre-condition and
  - $\bigotimes Q$  is called the *post-condition* of *S*.

イロト 不得下 イヨト イヨト

# Interpretations of a Hoare Triple

- A Hoare triple {P} S {Q} may be interpreted in two different ways:
  - Partial Correctness: if the execution of S starts in a state satisfying P and terminates, then it results in a state satisfying Q.
  - Total Correctness: if the execution of S starts in a state satisfying P, then it will terminate and result in a state satisfying Q.

Note: sometimes we write  $\langle P \rangle S \langle Q \rangle$  when total correctness is intended.

イロト イポト イヨト イヨト

# Pre and Post-Conditions for Specification

Find an integer approximate to the square root of another integer n:

$$\{0 \le n\} \ ? \ \{d^2 \le n < (d+1)^2\}$$

or slightly better (clearer about what can be changed)

$$\{0 \le n\} \ d := ? \ \{d^2 \le n < (d+1)^2\}$$

Find the index of value x in an array b:

Note: there are other ways to stipulate which variables are to be changed and which are not.

Yih-Kuen Tsay (IM.NTU)

Software Verification: Hoare Logic

SDM 2020 6 / 33

# A Little Bit of History

The following seminal paper started it all:

C.A.R. Hoare. An axiomatic basis for computer programs. CACM, 12(8):576-580, 1969.

- Original notation:  $P \{S\} Q$  (vs.  $\{P\} S \{Q\}$ )
- 😚 Interpretation: partial correctness
- Provided axioms and proof rules

Note: R.W. Floyd did something similar for flowcharts earlier in 1967, which was also a precursor of "proof outline" (a program fully annotated with assertions).

イロト イポト イヨト イヨト 二日

# **The Assignment Statement**

😚 Syntax:

$$x := E$$

- Meaning: execution of the assignment x := E (read as "x becomes E") evaluates E and stores the result in variable x.
- We will assume that expression E in x := E has no side-effect (i.e., does not change the value of any variable).
- Which of the following two Hoare triples is correct about the assignment x := E?

•  $\{P\} x := E \{P[E/x]\}$ 

 $\circledast \{Q[E/x]\} := E \{Q\}$ 

Note: *E* is essentially a first-order term.

# **Axiom of the Assignment Statement**

$$\{Q[E/x]\} x := E \{Q\}$$
(Assignment)

Why is this so?

- Let s be the state before x := E and s' the state after.
- So, s' = s[x := E] assuming E has no side-effect.
- Q[E/x] holds in s if and only if Q holds in s', because
  - every variable, except x, in Q[E/x] and Q has the same value in s and s', and
  - Q[E/x] has every x in Q replaced by E, while Q has every x evaluated to E in s' (= s[x := E]).

Yih-Kuen Tsay (IM.NTU)

SDM 2020 10 / 33

# The Multiple Assignment Statement

😚 Syntax:

$$x_1, x_2, \cdots, x_n := E_1, E_2, \cdots, E_n$$

where  $x_i$ 's are distinct variables.

- Meaning: execution of the multiple assignment evaluates all E<sub>i</sub>'s and stores the results in the corresponding variables x<sub>i</sub>'s.
- SExamples:

# **Simultaneous Substitution**

- P[E/x] can be naturally extended to allow E to be a list  $E_1, E_2, \dots, E_n$  and x to be  $x_1, x_2, \dots, x_n$ , all of which are distinct variables.
- P[E/x] is then the result of simultaneously replaying  $x_1, x_2, \dots, x_n$  with the corresponding expressions  $E_1, E_2, \dots, E_n$ ; enclose  $E_i$ 's in parentheses if necessary.

# Axiom of the Multiple Assignment

$$x_1, x_2, \cdots, x_n := E_1, E_2, \cdots, E_n$$

where  $x_i$ 's are distinct variables.

😚 Axiom:

 $\overline{\{Q[E_1, \cdots, E_n/x_1, \cdots, x_n]\} x_1, \cdots, x_n := E_1, \cdots, E_n \{Q\}}$ (Assign.)

Yih-Kuen Tsay (IM.NTU)

Software Verification: Hoare Logic

SDM 2020 14 / 33

# Assignment to an Array Entry

📀 Syntax:

$$b[i] := E$$

Notation for an altered array: (b; i : E) denotes the array that is identical to b, except that entry i stores the value of E.

$$(b; i: E)[j] = \begin{cases} E & \text{if } i = j \\ b[j] & \text{if } i \neq j \end{cases}$$

😚 Axiom:

$${Q[(b; i: E)/b]} b[i] := E {Q}$$

# Pre and Post-condition of a Loop

- A precondition just before a loop can capture the conditions for executing the loop.
- An assertion just within a loop body can capture the conditions for staying in the loop.
- A postcondition just after a loop can capture the conditions upon leaving the loop.

# A Simple Example

```
 \{x \ge 0 \land y > 0\} 
while x \ge y do
 \{x \ge 0 \land y > 0 \land x \ge y\} 
 x := x - y 
od
 \{x \ge 0 \land y > 0 \land x \not\ge y\} 
// or
 \{x \ge 0 \land y > 0 \land x < y\}
```

Yih-Kuen Tsay (IM.NTU)

Software Verification: Hoare Logic

SDM 2020 17 / 33

イロト 不得下 イヨト イヨト 二日

# More about the Example

We can say more about the program.

// may assume x, y := m, n here for some  $m \ge 0$  and n > 0  $\{x \ge 0 \land y > 0 \land (x \equiv m \pmod{y})\}$ while  $x \ge y$  do x := x - yod  $\{x \ge 0 \land y > 0 \land (x \equiv m \pmod{y}) \land x < y\}$ 

Note: repeated subtraction is a way to implement the integer division. So, the program is taking the residue of x divided by y.

Yih-Kuen Tsay (IM.NTU)

Software Verification: Hoare Logic

SDM 2020 18 / 33

# A Simple Programming Language

To study inference rules of Hoare logic, we consider a simple programming language with the following syntax for statements:

$$S ::= skip$$

$$| x := E$$

$$| S_1; S_2$$

$$| if B then S fi$$

$$| if B then S_1 else S_2 fi$$

$$| while B do S od$$

Software Verification: Hoare Logic

SDM 2020 19 / 33

#### **Proof Rules**

$$\{Q[E/x]\} x := E \{Q\}$$
(Assignment) $\{P\}$  skip  $\{P\}$ (Skip) $\{P\}$  skip  $\{P\}$ (Skip) $\{P\}$  slip  $\{Q\}$  $\{Q\}$  slip  $\{Q\}$  slip  $\{Q\}$  $\{P\}$  slip  $\{Q\}$  $\{Q\}$  slip  $\{Q\}$  $\{P \land B\}$  slip  $\{Q\}$  $\{P \land \neg B\}$  slip  $\{Q\}$  $\{P \land B\}$  slip  $\{Q\}$  $\{P \land \neg B\}$  slip  $\{Q\}$ "if B then s fi" can be treated as "if B then s else skip fi" ordirectly with the following rule: $\{P \land B\}$  slip  $\{Q\}$  $\{P \land B\}$  slip  $\{Q\}$  $P \land \neg B \rightarrow Q$  $\{P\}$  if B then s fi  $\{Q\}$ (If-Then)

Yih-Kuen Tsay (IM.NTU)

Software Verification: Hoare Logic

SDM 2020 20 / 33

# Proof Rules (cont.)

$$\frac{\{P \land B\} S \{P\}}{\{P\} \text{ while } B \text{ do } S \text{ od } \{P \land \neg B\}}$$
(While)  
$$\frac{P \rightarrow P'}{\{P\} S \{Q'\}} \frac{Q' \rightarrow Q}{\{P\} S \{Q\}}$$
(Consequence)

Note: with a suitable notion of validity, the set of proof rules up to now can be shown to be sound and (relatively) complete for programs that use only the considered constructs.

Yih-Kuen Tsay (IM.NTU)

Software Verification: Hoare Logic

SDM 2020 21 / 33

イロト 不得下 イヨト イヨト 二日

Some Auxiliary Rules	IM
$\frac{P \rightarrow P'  \{P'\} \ S \ \{Q\}}{\{P\} \ S \ \{Q\}}$	(Strengthening Precondition)
$\frac{\{P\} \ S \ \{Q'\} \qquad Q' \rightarrow Q}{\{P\} \ S \ \{Q\}}$	(Weakening Postcondition)
$\frac{\{P_1\} \ S \ \{Q_1\} \qquad \{P_2\} \ S \ \{Q_2\}}{\{P_1 \land P_2\} \ S \ \{Q_1 \land Q_2\}}$	(Conjunction)
$\{P_1\} S \{Q_1\} \{P_2\} S \{Q_2\}$	(Disjunction)

 $\{P_1 \lor P_2\} S \{Q_1 \lor Q_2\}$ 

Note: these rules provide more convenience, but do not actually add deductive power.

Yih-Kuen Tsay (IM.NTU)

Software Verification: Hoare Logic

SDM 2020 22 / 33

#### Invariants

- An *invariant* at some point of a program is an assertion that holds whenever execution of the program reaches that point.
- Assertion P in the rule for a while loop is called a *loop invariant* of the while loop.
- An assertion is called an *invariant of an operation* (a segment of code) if, assumed true before execution of the operation, the assertion remains true after execution of the operation.
- Invariants are a bridge between the static text of a program and its dynamic computation.

(日) (周) (三) (三)

# IM

# **Program Annotation**

Inserting assertions/invariants in a program as comments helps understanding of the program.

 $\{x \ge 0 \land y > 0 \land (x \equiv m \pmod{y})\}$ while  $x \ge y$  do  $\{x \ge 0 \land y > 0 \land x \ge y \land (x \equiv m \pmod{y})\}$ x := x - y $\{y > 0 \land x \ge 0 \land (x \equiv m \pmod{y})\}$ od

 $\{x \ge 0 \land y > 0 \land (x \equiv m \pmod{y})) \land x < y\}$ 

- A correct annotation of a program can be seen as a partial proof outline for the program.
- 😚 Boolean assertions can also be used as an aid to program testing.

# **An Annotated Program**

 $\{x \ge 0 \land y \ge 0 \land gcd(x, y) = gcd(m, n) \}$ while  $x \ne 0$  and  $y \ne 0$  do  $\{x \ge 0 \land y \ge 0 \land gcd(x, y) = gcd(m, n) \}$ if x < y then x, y := y, x fi;  $\{x \ge y \land y \ge 0 \land gcd(x, y) = gcd(m, n) \}$  x := x - y  $\{x \ge 0 \land y \ge 0 \land gcd(x, y) = gcd(m, n) \}$ od  $\{(x = 0 \land y \ge 0 \land y = gcd(x, y) = gcd(m, n)) \lor$   $(x \ge 0 \land y = 0 \land x = gcd(x, y) = gcd(m, n)) \}$ 

Note: m and n are two arbitrary non-negative integers, at least one of which is nonzero.

Yih-Kuen Tsay (IM.NTU)

Software Verification: Hoare Logic

SDM 2020 25 / 33

# **Total Correctness: Termination**

- All inference rules introduced so far, except the while rule, work for total correctness.
- Below is a rule for the total correctness of the **while** statement:

 $\{P \land B\} S \{P\} \qquad \{P \land B \land t = Z\} S \{t < Z\} \qquad P \to (t \ge 0)$ 

 $\{P\}$  while *B* do *S* od  $\{P \land \neg B\}$ 

where t is an integer-valued expression (state function) and Z is a "rigid" variable that does not occur in P, B, t, or S.

The above function *t* is called a *rank* (or variant) function.

SDM 2020 26 / 33

イロト イポト イヨト イヨト 二日

# **Termination of a Simple Program**

$$g, p := 0, n; // n \ge 1$$
  
while  $p \ge 2$  do  
 $g, p := g + 1, p - 1$   
od

- Loop Invariant:  $(g + p = n) \land (p \ge 1)$
- 😚 Rank (Variant) Function: *p*
- 📀 The loop terminates when p = 1  $(p \ge 1 \land p \not\ge 2)$ .

イロト 不得下 イヨト イヨト 二日

#### Well-Founded Sets

• A binary relation  $\preceq \subseteq A \times A$  is a **partial order** if it is

- ireflexive:  $\forall x \in A(x \leq x)$ ,
- transitive:  $\forall x, y, z \in A((x \preceq y \land y \preceq z) \rightarrow x \preceq z)$ , and
- initial antisymmetric:  $\forall x, y \in A((x \leq y \land y \leq x) \rightarrow x = y).$
- A partially ordered set (W, ≤) is well-founded if there is no infinite decreasing chain x<sub>1</sub> ≻ x<sub>2</sub> ≻ x<sub>3</sub> ≻ · · · of elements from W. (Note: "x ≻ y" means "y ≤ x ∧ y ≠ x".)
  Examples:

Yih-Kuen Tsay (IM.NTU)

Software Verification: Hoare Logic

SDM 2020 28 / 33

イロト 不得下 イヨト イヨト 二日

# **Termination by Well-Founded Induction**

Below is a more general rule for the total correctness of the **while** statement:

# $\{P \land B\} S \{P\} \qquad \{P \land B \land \delta = D\} S \{\delta \prec D\} \qquad P \to (\delta \in W)$ $\{P\} \text{ while } B \text{ do } S \text{ od } \{P \land \neg B\}$

where  $(W, \leq)$  is a well-founded set,  $\delta$  is a state function, and D is a "rigid" variable ranged over W that does not occur in P, B,  $\delta$ , or S.

#### Nondeterminism

Syntax of the Alternative Statement: **if**  $B_1 \rightarrow S_1$   $\| B_2 \rightarrow S_2$   $\dots$   $\| B_n \rightarrow S_n$ **fi** 

Each of the " $B_i \rightarrow S_i$ "s is called a guarded command, where  $B_i$  is the guard of the command and  $S_i$  the body.

Semantic:

- 1. One of the guarded commands, whose guard evaluates to true, is nondeterministically selected and its body executed.
- 2. If none of the guards evaluates to true, then the execution aborts.
