## Homework Assignment #4: Exercises on Design Patterns

## Due Time/Date

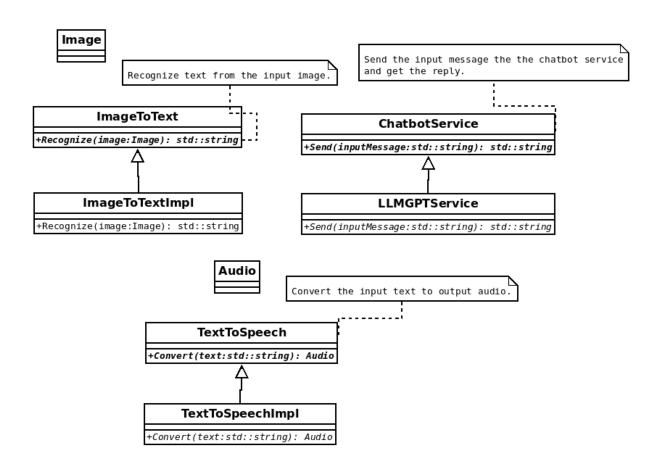

2:20PM Wednesday, May 1, 2024. Late submission will be penalized by 20% for each working day overdue.

## How to Submit

Please use a word processor or scan hand-written answers to produce a single PDF file. Name your file according to this pattern: "r127250xx-hw4". Add the PDF file to your remote individual repository on the Git server for this course. The remote repository should be named "hw4".

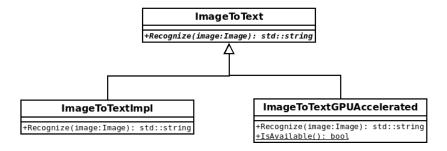

## **Problems**

1. You are working on an online service that allows the user to input an image of hand-written questions. The system answers the user's question as speech. The system has the following interfaces and concrete implementation classes of image-to-text, chatbox service and text-to-speech functions:

Suppose you want to make it easier for other services to use your image-to-speech answering service. It's a good idea to provide your service as a single interface so that the user doesn't need to interact with the individual classes.

- (a) (15 %) How can design patterns help solve this design problem?
- (b) (15 %) Please provide your design in a UML class diagram.
- 2. After your service went online, you found that the pure-software implementation of Image-ToTextImpl is too slow and consumes too much CPU time on your servers. You decided to accelerate text recognition using graphics hardware (GPU). The feature is provided by class ImageToTextGPUAccelerated:

Not all of your servers are equipped with the GPU hardware. Which image-to-text implementation class to use depends on the result of ImageToTextGPUAccelerated::IsAvailable(). In a sprint you managed to ship this improvement on time, but the code creates future maintenance problems. Your code base contains lots of snippets like:

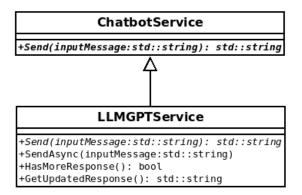

- (a) (15 %) What's the problem with the above design? How can design patterns help solve the maintenance problem?
- (b) (20 %) Please provide your solution in a class diagram.
- 3. You then find that the synchronous interface of ChatbotService isn't good for user experience: it may take 30 seconds or longer for the implementation class, LLMGPTService, to respond to a question. This means the user starts to hear the answer only after the full response is returned from the interface.

You notice that LLMGPTService provides an interface that allows you to get partial results. For example, after you send a message "What is virtual memory?", it can provide partial results like:

"Virtual memory is a technique used in computer operating system" after 1 second, "that allows a process to think" after 2 seconds

"that it can use the full contiguous address space" after 3 seconds and so forth until there is no more update.

It provides this feature in the following interface:

- (a) (15 %) How can design patterns be used to allow the user of the ChatbotService to get updates on new responses from the remote chatbot service?
- (b) (20 %) Please apply the pattern to LLMGPTService in code or a UML diagram
