イロト イポト イヨト イヨト

### **Overview**

- Given an adequate semantics for the programming language under consideration, the validity of a Hoare triple {p} S {q} can be precisely defined.
- A Hoare Logic for a programming language is sound if every Hoare triple proven by the logic is valid.
- A Hoare Logic for a programming language is complete if *every* valid Hoare triple can be proven by the logic.
- We shall develop these results for a very simple deterministic programming language.

# A Simple Programming Language

We will consider a Hoare Logic for the following simple (deterministic) programming language:

$$S ::= skip$$

$$| u := t$$

$$| S_1; S_2$$

$$| if B then S_1 else S_2 fi$$

$$| while B do S od$$

Note: here t is an expression (first-order term) of the same type as variable u; B is a boolean expression.

We consider only programs that are free of syntactical or typing errors.

イロト イポト イヨト イヨト

#### **Proof Rules of Hoare Logic**

$\{q[t/u]\}\ u := t\ \{q\}$	(Assignment)
${p} skip {p}$	(Skip)
$\frac{\{p\} \ S_1 \ \{q\} \qquad \{q\} \ S_2 \ \{r\}}{\{p\} \ S_1; S_2 \ \{r\}}$	(Sequence)
$\frac{\{p \land B\} S_1 \{q\} \qquad \{p \land \neg B\} S_2 \{q\}}{\{p\} \text{ if } B \text{ then } S_1 \text{ else } S_2 \text{ fi } \{q\}}$	(Conditional)

# **Operational Semantics**

- A program/statement with a start state is seen as an abstract machine.
- (1) The part of program that remains to be executed and (2) the current state constitute the configuration of the abstract machine.
- By executing the program step by step, the machine transforms from one configuration to another.
- A transition relation naturally arises between configurations.
- The (input/output) semantics *M*[S] of a program *S* can then be defined with the help of the above transition relation.

イロト 不得下 イヨト イヨト 二日

# **Operational Semantics (cont.)**

- At a high level, a configuration is a pair  $\langle S, \sigma \rangle$  where S is a program and  $\sigma$  is a "proper" state.
- 📀 A transition

$$\langle S, \sigma \rangle \to \langle R, \tau \rangle$$

means "executing S one step in state  $\sigma$  leads to state  $\tau$  with R as the remainder of S to be executed."

- Let E denote the empty program. When the remainder R equals E, it means that S has terminated.
- The transition relation → can be defined inductively (in the form of axioms and rules) over the structure of a program.

イロト 人間ト イヨト イヨト

### Semantics of the Simple Language

To give an operational semantics of the simple language, we postulate the following transition axioms and rules:

1. 
$$\langle \mathbf{skip}, \sigma \rangle \rightarrow \langle E, \sigma \rangle$$
  
2.  $\langle u := t, \sigma \rangle \rightarrow \langle E, \sigma[u := \sigma(t)] \rangle$   
3.  $\frac{\langle S_1, \sigma \rangle \rightarrow \langle S_2, \tau \rangle}{\langle S_1; S, \sigma \rangle \rightarrow \langle S_2; S, \tau \rangle}$   
4.  $\langle \mathbf{if} \ B \ \mathbf{then} \ S_1 \ \mathbf{else} \ S_2 \ \mathbf{fi}, \sigma \rangle \rightarrow \langle S_1, \sigma \rangle, \ \mathbf{when} \ \sigma \models B$   
5.  $\langle \mathbf{if} \ B \ \mathbf{then} \ S_1 \ \mathbf{else} \ S_2 \ \mathbf{fi}, \sigma \rangle \rightarrow \langle S_2, \sigma \rangle, \ \mathbf{when} \ \sigma \models \neg B$   
6.  $\langle \mathbf{while} \ B \ \mathbf{do} \ S \ \mathbf{od}, \sigma \rangle \rightarrow \langle E, \sigma \rangle, \ \mathbf{when} \ \sigma \models \neg B$ 

Yih-Kuen Tsay (IM.NTU)

Soundness and Completeness of Hoare Logic

SSV 2011 8 / 30

イロト イポト イヨト イヨト

#### **Transition Systems**

- The preceding set of transition axioms and rules can be seen as a formal proof system, called a transition system.
- A transition  $\langle S, \sigma \rangle \rightarrow \langle R, \tau \rangle$  is possible if it can be deduced in the transition system.
- This semantic is "high level", as assignments and evaluations of Boolean expressions are done in one step.

イロト 人間ト イヨト イヨト

**Transition Sequences and Computations** 

• A *transition sequence of S starting in*  $\sigma$  is a finite or infinite sequence of configurations

$$\langle S_0, \sigma_0 \rangle (= \langle S, \sigma \rangle) \rightarrow \langle S_1, \sigma_1 \rangle \rightarrow \cdots \rightarrow \langle S_i, \sigma_i \rangle \rightarrow \cdots$$

- A computation of S starting in  $\sigma$  is a transition sequence of S starting in  $\sigma$  that cannot be extended.
- A computation of S terminates in τ if it is finite and its last configuration is (E, τ).
- A computation of S diverges if it is infinite.

イロト 人間ト イヨト イヨト

### An Example

📀 Consider the following program

 $S \equiv a[0] := 1$ ; a[1] := 0; while  $a[x] \neq 0$  do x := x + 1 od

- Let  $\sigma$  be a state in which x is 0.
- Solution Let  $\sigma'$  stand for  $\sigma[a[0] := 1][a[1] := 0]$ .
- igstarrow The following is the computation of S starting in  $\sigma$ :

$$\begin{array}{l} \langle S, \sigma \rangle \\ \rightarrow & \langle a[1] := 0; \text{ while } a[x] \neq 0 \text{ do } x := x + 1 \text{ od}, \sigma[a[0] := 1] \rangle \\ \rightarrow & \langle \text{while } a[x] \neq 0 \text{ do } x := x + 1 \text{ od}, \sigma' \rangle \\ \rightarrow & \langle x := x + 1; \text{ while } a[x] \neq 0 \text{ do } x := x + 1 \text{ od}, \sigma' \rangle \\ \rightarrow & \langle \text{while } a[x] \neq 0 \text{ do } x := x + 1 \text{ od}, \sigma'[x := 1] \rangle \\ \rightarrow & \langle E, \sigma'[x := 1] \rangle \end{array}$$

Yih-Kuen Tsay (IM.NTU)

### **Finite Transition Sequences**

- For partial correctness of sequential programs, we will need only to talk about finite transition sequences.
- To that end, we take the reflexive transitive closure  $\rightarrow^*$  of  $\rightarrow$ .
- So,  $\langle S, \sigma \rangle \to^* \langle R, \tau \rangle$  holds when 1.  $\langle R, \tau \rangle = \langle S, \sigma \rangle$  or 2.  $\langle S_0, \sigma_0 \rangle (= \langle S, \sigma \rangle) \to \langle S_1, \sigma_1 \rangle \to \cdots \to \langle S_n, \sigma_n \rangle (= \langle R, \tau \rangle)$  is a finite transition sequence.

# Input/Output Semantics

 $\ref{eq: 1}$  Let  $\Sigma$  be the set of all "proper" states.

The partial correctness semantics is a mapping  $\mathcal{M}[\![S]\!]: \Sigma \to \mathcal{P}(\Sigma)$ 

with

$$\mathcal{M}\llbracket S \rrbracket(\sigma) = \{ \tau \mid \langle S, \sigma \rangle \to^* \langle E, \tau \rangle \}.$$

Extensions of *M*[S]

$$\stackrel{\text{\tiny{(1)}}}{=} \mathcal{M}[\![S]\!](\bot) = \emptyset.$$

Sor X ⊆ Σ ∪ {⊥}, M[S](X) = ⋃<sub>σ∈X</sub> M[S](σ).

イロト 不得 トイヨト イヨト 二日

### Validity of a Hoare Triple

- Let [[p]] denote {σ ∈ Σ | σ ⊨ p}, i.e., the set of states where p holds.
- The Hoare triple {p} S {q} is valid in the sense of partial correctness, written  $\models$  {p} S {q}, if

 $\mathcal{M}\llbracket S \rrbracket(\llbracket p \rrbracket) \subseteq \llbracket q \rrbracket.$ 

Yih-Kuen Tsay (IM.NTU)

Soundness and Completeness of Hoare Logic

SSV 2011 14 / 30

• Let  $\Omega$  be a program such that  $\mathcal{M}[\![\Omega]\!](\sigma) = \emptyset$ , for any  $\sigma$ .

Define the following sequence of deterministic programs:

(while 
$$B$$
 do  $S$  od)<sup>0</sup> =  $\Omega$   
(while  $B$  do  $S$  od)<sup>k+1</sup> = if  $B$  then  $S$ ; (while  $B$  do  $S$  od)<sup>k</sup>  
else skip fi.

・ロト ・ 個 ト ・ ヨ ト ・ ヨ ト

### Lemmas for $\mathcal{M}[\![S]\!]$

- M[[S]] is monotonic, i.e., X ⊆ Y ⊆ Σ ∪ {⊥} implies M[[S]](X) ⊆ M[[S]](Y).
   M[[S<sub>1</sub>; S<sub>2</sub>]](X) = M[[S<sub>2</sub>]](M[[S<sub>1</sub>]](X)).
- 3.  $\mathcal{M}[[(S_1; S_2); S_3]](X) = \mathcal{M}[[S_1; (S_2; S_3)]](X).$
- 4.  $\mathcal{M}[\![\mathbf{if} \ B \ \mathbf{then} \ S_1 \ \mathbf{else} \ S_2 \ \mathbf{fi}]\!](X) = \mathcal{M}[\![S_1]\!](X \cap [\![B]\!]) \cup \mathcal{M}[\![S_2]\!](X \cap [\![\neg B]\!]).$
- 5.  $\mathcal{M}[\![\text{while } B \text{ do } S \text{ od}]\!] = \bigcup_{k=0}^{\infty} \mathcal{M}[\![(\text{while } B \text{ do } S \text{ od})^k]\!].$

#### **Soundness**

**Theorem** (Soundness): The proof system *PD* is sound for partial correctness of programs in the simple programming language, i.e.,

```
\vdash_{PD} \{p\} S \{q\} \text{ implies } \models \{p\} S \{q\}.
```

It suffices to prove that (1) the Hoare triples in all axioms of *PD* are valid and (2) all proof rules of *PD* are sound.

Note: a proof rule is sound if the validity of the Hoare triples in the premises implies the validity of the Hoare triple in the conclusion.

Skip: 
$$\mathcal{M}[\![skip]\!]([\![p]\!]) \subseteq [\![p]\!]$$

$$\mathcal{M}\llbracket \mathbf{skip} \rrbracket(\llbracket p \rrbracket) = \bigcup_{\sigma \in \llbracket p \rrbracket} \{\tau \mid \langle \mathbf{skip}, \sigma \rangle \to^* \langle E, \tau \rangle \}$$
$$= \bigcup_{\sigma \in \llbracket p \rrbracket} \{\sigma\} = \llbracket p \rrbracket \subseteq \llbracket p \rrbracket.$$

Assignment:  $\mathcal{M}\llbracket u := t \rrbracket (\llbracket p[t/u] \rrbracket) \subseteq \llbracket p \rrbracket$ 

It can be shown that (1)  $\sigma(s[u := t]) = \sigma[u := \sigma(t)](s)$  and (2)  $\sigma \models p[t/u]$  iff  $\sigma[u := \sigma(t)] \models p$ .

Let 
$$\sigma \in \llbracket p[t/u] \rrbracket$$
.  
From the transition axiom for assignment,  
 $\mathcal{M}\llbracket u := t \rrbracket (\sigma) = \{ \sigma[u := \sigma(t)] \}.$   
Since  $\sigma \models p[t/u]$  iff  $\sigma[u := \sigma(t)] \models p$ , we have  
 $\mathcal{M}\llbracket u := t \rrbracket (\sigma) \subseteq \llbracket p \rrbracket$  and hence  $\mathcal{M}\llbracket u := t \rrbracket (\llbracket p[t/u] \rrbracket) \subseteq \llbracket p \rrbracket.$ 

Composition:  $\mathcal{M}[\![S_1]\!]([\![p]\!]) \subseteq [\![r]\!]$  and  $\mathcal{M}[\![S_2]\!]([\![r]\!]) \subseteq [\![q]\!]$  imply  $\mathcal{M}[\![S_1; S_2]\!]([\![p]\!]) \subseteq [\![q]\!]$ .

From the monotonicity of  $\mathcal{M}[\![S_2]\!]$ ,  $\mathcal{M}[\![S_2]\!](\mathcal{M}[\![S_1]\!]([\![p]\!])) \subseteq \mathcal{M}[\![S_2]\!]([\![r]\!]) \subseteq [\![q]\!]$ .

By an earlier lemma,  $\mathcal{M}\llbracket S_2 \rrbracket (\mathcal{M}\llbracket S_1 \rrbracket (\llbracket p \rrbracket)) = \mathcal{M}\llbracket S_1; S_2 \rrbracket (\llbracket p \rrbracket).$ 

Conditional:  $\mathcal{M}[S_1]([p \land B]) \subseteq [q]$  and  $\mathcal{M}[S_2]([p \land \neg B]) \subseteq [q]$  imply  $\mathcal{M}[if B \text{ then } S_1 \text{ else } S_2 \text{ fi}]([p]) \subseteq [q].$ 

This follows from an earlier lemma,  $\mathcal{M}[\![\mathbf{if} \ B \ \mathbf{then} \ S_1 \ \mathbf{else} \ S_2 \ \mathbf{fi}]\!](X) =$  $\mathcal{M}[\![S_1]\!](X \cap [\![B]\!]) \cup \mathcal{M}[\![S_2]\!](X \cap [\![\neg B]\!]).$ 

Yih-Kuen Tsay (IM.NTU)

• While:  $\mathcal{M}[\![S]\!]([\![p \land B]\!]) \subseteq [\![p]\!]$  implies  $\mathcal{M}[\![while B \text{ do } S \text{ od}]\!]([\![p]\!]) \subseteq [\![p \land \neg B]\!].$ 

From Lemma 5 for  $\mathcal{M}\llbracket \cdot \rrbracket$ , it boils down to show that  $\bigcup_{k=0}^{\infty} \mathcal{M}\llbracket (\text{while } B \text{ do } S \text{ od})^k \rrbracket (\llbracket p \rrbracket) \subseteq \llbracket p \land \neg B \rrbracket$ .

We prove by induction that, for all  $k \ge 0$ ,

 $\mathcal{M}$ [[(while *B* do *S* od)<sup>*k*</sup>]]([[*p*]])  $\subseteq$  [[ $p \land \neg B$ ]].

The base case k = 0 is clear.

Yih-Kuen Tsay (IM.NTU)

Soundness and Completeness of Hoare Logic

SSV 2011 20 / 30

 $\mathcal{M}$ [(while B do S od)<sup>k+1</sup>]([p]) = { definition of (while B do S od)<sup>k+1</sup> }  $\mathcal{M}$ [if B then S; (while B do S od)<sup>k</sup> else skip fi]([p]) = { Lemma 4 for  $\mathcal{M}[\![\cdot]\!]$  }  $\mathcal{M}[S]$ ; (while B do S od)<sup>k</sup> ( $[p \land B]$ )  $\cup \mathcal{M}[skip]([p \land \neg B])$ = { Lemma 2 for  $\mathcal{M}[\cdot]$  and semantics of **skip** }  $\mathcal{M}$ [(while B do S od)<sup>k</sup>]( $\mathcal{M}$ [S][ $p \land B$ ])  $\cup$  [ $p \land \neg B$ ]  $\subseteq$  { the premise and monotonicity of  $\mathcal{M}[\cdot]$  }  $\mathcal{M}$ [(while *B* do *S* od)<sup>*k*</sup>]([*p*])  $\cup$  [*p*  $\wedge \neg B$ ]  $\subseteq$  { induction hypothesis }  $[p \land \neg B](\cup [p \land \neg B])$

SSV 2011 21 / 30

- Consequence:  $p \to p'$ ,  $\mathcal{M}[S]([p']) \subseteq [q']$ , and  $q' \to q$  imply  $\mathcal{M}[S]([p]) \subseteq [q]$ .
  - First of all,  $\llbracket p \rrbracket \subseteq \llbracket p' \rrbracket$  and  $\llbracket q' \rrbracket \subseteq \llbracket q \rrbracket$ .
  - From the monotonicity of  $\mathcal{M}[\![S]\!]$ ,  $\mathcal{M}[\![S]\!]([\![p]\!]) \subseteq \mathcal{M}[\![S]\!]([\![p']\!]) \subseteq [\![q']\!] \subseteq [\![q]\!]$ .

イロト イポト イヨト イヨト

### **About Completeness**

- Assertions that we use for a programming language often involve numbers/integers.
- According to Gödel's First Incompleteness Theorem, there is no complete proof system (that is consistent/sound) for the first-order theory of arithmetic.
- We therefore assume that all true assertions are given (as axioms).
- The completeness of Hoare Logic then is actually relative to the truth of all assertions.

イロト 人間ト イヨト イヨト

### Weakest Liberal Precondition

Let S be a program in the simple programming language.
 For a set Φ of states, we define

### $wlp(S,\Phi) = \{ \sigma \mid \mathcal{M}\llbracket S \rrbracket(\sigma) \subseteq \Phi \}.$

- wlp(S,Φ) is called the weakest liberal precondition of S with respect to Φ.
- Informally,  $wlp(S, \Phi)$  is the set of all states  $\sigma$  such that whenever S is activated in  $\sigma$  and properly terminates, the output state is in  $\Phi$ .

イロト 不得下 イヨト イヨト 二日

# **Definability of** $wlp(S, \Phi)$

- An assertion p defines a set  $\Phi$  of states if  $\llbracket p \rrbracket = \Phi$ .
- Assuming that the assertion language includes addition and multiplication of natural numbers,

there is an assertion p defining  $wlp(S, \llbracket q \rrbracket)$ , i.e., with  $\llbracket p \rrbracket = wlp(S, \llbracket q \rrbracket)$ .

- Proof of the above statement requires a technique called Gödelization and will not be given here.
- We will write wlp(S, q) to denote the assertion p such that
  [[p]] = wlp(S, [[q]]).

Yih-Kuen Tsay (IM.NTU)

#### Lemmas for wlp

- 1.  $wlp(skip, q) \leftrightarrow q$ .
- 2.  $wlp(u := t, q) \leftrightarrow q[t/u].$
- 3.  $wlp(S_1; S_2, q) \leftrightarrow wlp(S_1, wlp(S_2, q)).$
- 4.  $wlp(\text{if } B \text{ then } S_1 \text{ else } S_2 \text{ fi}, q) \leftrightarrow (B \wedge wlp(S_1, q)) \vee (\neg B \wedge wlp(S_2, q)).$
- 5.  $wlp(while B \text{ do } S_1 \text{ od}, q) \land B \rightarrow wlp(S_1, wlp(while B \text{ do } S_1 \text{ od}, q)).$
- 6. wlp(while B do  $S_1$  od, q)  $\land \neg B \rightarrow q$ .
- 7.  $\models \{p\} S \{q\} \text{ iff } p \rightarrow wlp(S,q).$

Soundness and Completeness of Hoare Logic

SSV 2011 26 / 30

イロト イポト イヨト イヨト 二日

### Completeness

**Theorem** (Completeness): The proof system *PD* is complete for partial correctness of programs in the simple programming language, i.e.,

 $\models \{p\} S \{q\} \text{ implies } \vdash_{PD} \{p\} S \{q\}.$ 

We first prove  $\vdash_{PD} \{ w | p(S, q) \} S \{q\}$ , for all S and q. This is done by induction.

The base cases (skip and assignment) are trivial.

Yih-Kuen Tsay (IM.NTU)

Soundness and Completeness of Hoare Logic

# **Completeness (cont.)**

• Conditional:  $S \equiv \mathbf{if} \ B \mathbf{then} \ S_1 \mathbf{else} \ S_2 \mathbf{fi}$ .

From Lemma 4 for *wlp*, we have (1)  $wlp(S,q) \land B \rightarrow wlp(S_1,q)$  and (2)  $wlp(S,q) \land \neg B \rightarrow wlp(S_2,q)$ .

From the induction hypothesis, we have (3)  $\vdash_{PD} \{ wlp(S_1, q) \} S_1 \{q\} \text{ and} (4) \vdash_{PD} \{ wlp(S_2, q) \} S_2 \{q\}.$ 

Applying the consequence rule to (1) and (3) and to (2) and (4), we have  $\vdash_{PD} \{wlp(S,q) \land B\} S_1 \{q\}$  and  $\vdash_{PD} \{wlp(S,q) \land \neg B\} S_2 \{q\}.$ 

From the conditional rule, we have  $\vdash_{PD} \{wlp(S,q)\} S \{q\}$ .

Yih-Kuen Tsay (IM.NTU)

# Completeness (cont.)

• While:  $S \equiv$  while *B* do  $S_1$  od.

The induction hypothesis states that  $\vdash_{PD} \{ wlp(S_1, wlp(S, q)) \} S_1 \{ wlp(S, q) \}.$ 

Then, from Lemma 5 for *wlp* and the consequence rule,  $\vdash_{PD} \{ wlp(S,q) \land B \} S_1 \{ wlp(S,q) \}.$ 

So, from the while rule,  $\vdash_{PD} \{ wlp(S,q) \} S \{ wlp(S,q) \land \neg B \}.$ 

From Lemma 6 for *wlp* and the consequence rule,  $\vdash_{PD} \{wlp(S,q)\} S \{q\}.$ 

Yih-Kuen Tsay (IM.NTU)

Soundness and Completeness of Hoare Logic

# Completeness (cont.)

- Solution Now suppose  $\models \{p\} S \{q\}$ .
- From Lemma 7 for wlp,  $p \rightarrow wlp(S, q)$ .
- From  $\vdash_{PD} \{ wlp(S,q) \} S \{q\}$  and the consequence rule,  $\vdash_{PD} \{p\} S \{q\}.$

イロト 不得下 イヨト イヨト 二日
