First-Order Logic

SSV 2021 1 / 34

イロト イポト イヨト イヨト

Introduction

- 📀 Logic concerns two concepts:
 - truth (in a specific or general context)
 - provability (of truth from assumed truth)
- Formal (symbolic) logic approaches logic by rules for manipulating symbols:
 - Syntax rules: for writing statements (or formulae).
 (There are also semantic rules determining whether a statement is true or false in a context or mathematical structure.)
 - Inference rules: for obtaining true statements from other true statements.
- We shall introduce two main branches of formal logic:
 - 🌻 propositional logic
 - first-order logic (predicate logic/calculus)
- This lecture covers first-order logic.

Yih-Kuen Tsay (IM.NTU)

Why We Need Logic

- Correctness of software hinges on a precise statement of its requirements.
- Logical formulae give the most precise kind of statements about software requirements.
- The fact that "a software program satisfies a requirement" is very much the same as "a mathematical structure satisfies a logical formula":

 $prog \models req$ vs. $M \models \varphi$

- To prove (formally verify) that a software program is correct, one may utilize the kind of inferences seen in formal logic.
- The verification may be done manually, semi-automatically, or fully automatically.

Yih-Kuen Tsay (IM.NTU)

SSV 2021 3 / 34

Predicates

- A predicate is a "parameterized" statement that, when supplied with actual arguments, is either true or false such as the following:
 - Leslie is a teacher.
 - Chris is a teacher.
 - Leslie is a pop singer.
 - Chris is a pop singer.
- Like propositions, simplest (atomic) predicates may be combined to form compound predicates.

(日) (同) (三) (三)

Inferences

- *For any* person, *either* the person is not a teacher *or* the person is not rich.
- For any person, if the person is a pop singer, then the person is rich.
- We wish to conclude the following:
 - For any person, if the person is a teacher, then the person is not a pop singer.

Symbolic Predicates

Like propositions, predicates are represented by symbols.

- (x): x is a teacher.
- (x): x is rich.
- r(y): y is a pop singer.
- Compound predicates can be expressed:
 - For all $x, r(x) \rightarrow q(x)$: For any person, if the person is a pop singer, then the person is rich.
 - For all y, $p(y) \rightarrow \neg r(y)$: For any person, if the person is a teacher, then the person is not a pop singer.

SSV 2021 6 / 34

Symbolic Inferences

😚 We are given the following assumptions:

- ♦ For all $x, \neg p(x) \lor \neg q(x)$.
- For all $x, r(x) \to q(x)$.
- 😚 We wish to conclude the following:

 \circledast For all $x, p(x) \rightarrow \neg r(x)$.

To check the correctness of the inference above, we ask: Is ((for all x, ¬p(x) ∨ ¬q(x)) ∧ (for all x, r(x) → q(x))) → (for all x, p(x) → ¬r(x)) valid?

SSV 2021 7 / 34

Syntax

Subject Symbols:

- A countable set V of variables: x, y, z, ...;
- Logical connectives (operators): ¬, ∧, ∨, →, ↔, ⊥, ∀ (for all), ∃ (there exists);
- 🌻 Auxiliary symbols: "(", ")".
- Non-logical symbols:
 - A countable set of *function symbols* with associated ranks (arities);
 - A countable set of *constants* (which may be seen as functions with rank 0);
 - A countable set of *predicate symbols* with associated ranks (arities);
- We refer to a first-order language as Language L, where L is the set of non-logical symbols (e.g., {+, 0, 1, <}). The set L is usually referred to as the signature of the first-order language.</p>

Yih-Kuen Tsay (IM.NTU)

◆□▶ ◆圖▶ ◆圖▶ ◆圖▶ ─ 圖

Syntax (cont.)

😚 Terms:

- Every constant and every variable is a term.
- If t_1, t_2, \dots, t_k are terms and f is a k-ary function symbol (k > 0), then $f(t_1, t_2, \dots, t_k)$ is a term.

📀 Atomic formulae:

- Every predicate symbol of 0-arity is an atomic formula and so is 1.
- * If t_1, t_2, \dots, t_k are terms and p is a k-ary predicate symbol (k > 0), then $p(t_1, t_2, \dots, t_k)$ is an atomic formula.
- For example, consider Language $\{+, 0, 1, <\}$.
 - 0, x, x + 1, x + (x + 1), etc. are terms.
 - ightarrow 0 < 1, x < (x + 1), etc. are atomic formulae.

Yih-Kuen Tsay (IM.NTU)

SSV 2021 9 / 34

◆□▶ ◆圖▶ ◆圖▶ ◆圖▶ ─ 圖

Syntax (cont.)

😚 Formulae:

- Every atomic formula is a formula.
- If A and B are formulae, then so are $\neg A$, $(A \land B)$, $(A \lor B)$, $(A \lor B)$, $(A \to B)$, and $(A \leftrightarrow B)$.
- ♦ If x is a variable and A is a formula, then so are $\forall xA$ and $\exists xA$.
- First-order logic with equality includes equality (=) as an additional logical symbol, which behaves like a predicate symbol.
- Second terms of the term of term

$$\begin{array}{l} \circledast \ (0 < x) \lor (x < 1) \\ \circledast \ \forall x (\exists y (x + y = 0)) \end{array}$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Syntax (cont.)

We may give the logical connectives different binding powers, or precedences, to avoid excessive parentheses, usually in this order:

$$\neg, \{\forall, \exists\}, \{\land, \lor\}, \rightarrow, \leftrightarrow.$$

For example, $(A \land B) \rightarrow C$ becomes $A \land B \rightarrow C$.

Common abbreviations:

$$x = y = z$$
 means $x = y \land y = z$.

- $p \rightarrow q \rightarrow r$ means $p \rightarrow (q \rightarrow r)$. Implication associates to the right, so do other logical symbols.
- $\forall x, y, zA \text{ means } \forall x(\forall y(\forall zA)).$

Yih-Kuen Tsay (IM.NTU)

SSV 2021 11 / 34

イロト イポト イヨト イヨト 二日

Free and Bound Variables

- In a formula ∀xA (or ∃xA), the variable x is bound by the quantifier ∀ (or ∃).
- A *free* variable is one that is not bound.
- The same variable may have both a free and a bound occurrence.
- For example, consider (∀x(R(x, y) → P(x)) ∧ ∀y(¬R(x, y) ∧ ∀xP(x))). The underlined occurrences of x and y are free, while others are bound.
- A formula is *closed*, also called a *sentence*, if it does not contain a free variable.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

For a term t, the set FV(t) of free variables of t is defined inductively as follows:

•
$$FV(x) = \{x\}$$
, for a variable x;

•
$$FV(c) = \emptyset$$
, for a contant c ;

• $FV(f(t_1, t_2, \dots, t_n)) = FV(t_1) \cup FV(t_2) \cup \dots \cup FV(t_n)$, for an *n*-ary function *f* applied to *n* terms t_1, t_2, \dots, t_n .

Free Variables Formally Defined (cont.)

For a formula A, the set FV(A) of free variables of A is defined inductively as follows:

FV(*P*(*t*₁, *t*₂, ..., *t_n*)) = *FV*(*t*₁) ∪ *FV*(*t*₂) ∪ ... ∪ *FV*(*t_n*), for an *n*-ary predicate *P* applied to *n* terms *t*₁, *t*₂, ..., *t_n*; *FV*(*t*₁ = *t*₂) = *FV*(*t*₁) ∪ *FV*(*t*₂); *FV*(¬*B*) = *FV*(*B*); *FV*(¬*B*) = *FV*(*B*); *FV*(B * *C*) = *FV*(*B*) ∪ *FV*(*C*), where * ∈ {∧, ∨, →, ↔}; *FV*(⊥) = ∅; *FV*(∀*xB*) = *FV*(*B*) - {*x*}; *FV*(∃*xB*) = *FV*(*B*) - {*x*}.

Yih-Kuen Tsay (IM.NTU)

First-Order Logic

SSV 2021 14 / 34

Bound Variables Formally Defined

For a formula A, the set BV(A) of bound variables in A is defined inductively as follows:

• $BV(P(t_1, t_2, \dots, t_n)) = \emptyset$, for an *n*-ary predicate *P* applied to *n* terms t_1, t_2, \dots, t_n ;

•
$$BV(t_1 = t_2) = \emptyset;$$

$$\bigcirc BV(\neg B) = BV(B);$$

 $\bigcirc BV(B * C) = BV(B) \cup BV(C)$, where $* \in \{\land, \lor,
ightarrow, \leftrightarrow\}$;

$$\bullet BV(\bot) = \emptyset;$$

$$\ \odot \ BV(\forall xB) = BV(B) \cup \{x\};$$

First-Order Structures

- A first-order structure \mathcal{M} is a pair (M, I), where
 - *M* (a non-empty set) is the *domain* of the structure, and
 - I is the *interpretation function*, that assigns functions and predicates over M to the function and predicate symbols.
- An interpretation may be represented by simply listing the functions and predicates.
- For instance, $(Z, \{+_Z, 0_Z\})$ is a structure for the language $\{+, 0\}$. The subscripts are omitted, as $(Z, \{+, 0\})$, when no confusion may arise.

Semantics

- Since a formula may contain free variables, its truth value depends on the specific values that are assigned to these variables.
- Given a first-order language and a structure $\mathcal{M} = (M, I)$, an *assignment* is a function from the set of variables to M.
- The structure \mathcal{M} along with an assignment s determines the truth value of a formula A, denoted as $A_{\mathcal{M}}[s]$.
- For example, $(x + 0 = x)_{(Z,\{+,0\})}[x := 1]$ evaluates to T.

Semantics (cont.)

- We say M, s ⊨ A when A_M[s] is T (true) and M, s ⊭ A otherwise.
- Alternatively, |= may be defined as follows (propositional part is as in propositional logic):

 $\begin{array}{ll} \mathcal{M},s\models\forall xA & \Longleftrightarrow & \mathcal{M},s[x:=m]\models A \ \text{for all } m\in M.\\ \mathcal{M},s\models\exists xA & \Longleftrightarrow & \mathcal{M},s[x:=m]\models A \ \text{for some } m\in M.\\ \text{where } s[x:=m] \ \text{denotes an updated assignment } s' \ \text{from } s \ \text{such that } s'(y)=s(y) \ \text{for } y\neq x \ \text{and } s'(x)=m. \end{array}$

For example, $(Z, \{+, 0\}), s \models \forall x(x + 0 = x)$ holds, since $(Z, \{+, 0\}), s[x := m] \models x + 0 = x$ for all $m \in Z$.

Yih-Kuen Tsay (IM.NTU)

SSV 2021 18 / 34

What about Types

- Ordinary first-order formulae are interpreted over a single domain of discourse (the universe).
- A variant of first-order logic, called many-sorted (or typed) first-order logic, allows variables of different sorts (which correspond to partitions of the universe).
- When the number of sorts is finite, one can emulate sorts by introducing additional unary predicates in the ordinary first-order logic.
 - Suppose there are two sorts.
 - Ne introduce two new unary predicates P_1 and P_2 .
 - We then stipulate that $\forall x(P_1(x) \lor P_2(x)) \land \neg (\exists x(P_1(x) \land P_2(x))).$
 - * For example, $\exists x (P_1(x) \land \varphi(x))$ means that there is an element of the first sort satisfying φ ; $\forall x (P_1(x) \rightarrow \psi(x))$ means that every element of the first sort satisfies ψ .

Yih-Kuen Tsay (IM.NTU)

SSV 2021 19 / 34

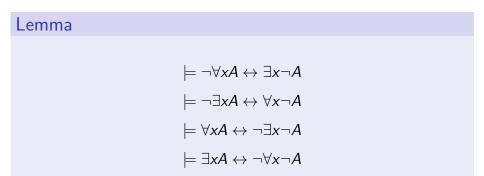

Satisfiability and Validity

- A formula A is *satisfiable in* \mathcal{M} if there is an assignment s such that $\mathcal{M}, s \models A$.
- A formula A is valid in \mathcal{M} , denoted $\mathcal{M} \models A$, if $\mathcal{M}, s \models A$ for every assignment s.
- For instance, $\forall x(x + 0 = x)$ is valid in $(Z, \{+, 0\})$.
- \mathcal{M} is called a *model* of A if A is valid in \mathcal{M} .
- A formula A is *valid* if it is valid in every structure, denoted $\models A$.

Relating the Quantifiers

Note: These equivalences show that, with the help of negation, either quantifier can be expressed by the other.

Yih-Kuen Tsay (IM.NTU)

First-Order Logic

SSV 2021 21 / 34

Substitutions

- 📀 Let t be a term and A a formula.
- The result of substituting t for a free variable x in A is denoted by A[t/x].
- Consider $A = \forall x (P(x) \rightarrow Q(x, f(y))).$
 - When t = g(y), $A[t/y] = \forall x(P(x) \rightarrow Q(x, f(g(y))))$.
 - For any t, A[t/x] = ∀x(P(x) → Q(x, f(y))) = A, since there is no free occurrence of x in A.
- A substitution is *admissible* if no free variable of *t* would become bound (be captured by a quantifier) after the substitution.
- For example, when t = g(x, y), A[t/y] is not admissible, as the free variable x of t would become bound.

Yih-Kuen Tsay (IM.NTU)

SSV 2021 22 / 34

Substitutions (cont.)

- Suppose we change the bound variable x in A to z and obtain another formula $A' = \forall z(P(z) \rightarrow Q(z, f(y))).$
- Intuitively, A' and A should be equivalent (under any reasonable semantics). (Technically, the two formulae A and A' are said to be α-equivalent.)
- We can avoid the capture in A[g(x, y)/y] by renaming the bound variable x to z and the result of the substitution then becomes $A'[g(x, y)/y] = \forall z(P(z) \rightarrow Q(z, f(g(x, y)))).$
- So, in principle, we can make every substitution admissible while preserving the semantics.

Let s and t be terms. The result of substituting t in s for a variable x, denoted s[t/x], is defined inductively as follows:

•
$$x[t/x] = t;$$

• $y[t/x] = y$, for a variable y that is not x;
• $c[t/x] = c$, for a contant c;
• $f(t, t, t) = f(t, t) = f(t, t) = f(t, t)$

•
$$f(t_1, t_2, \cdots, t_n)[t/x] = f(t_1[t/x], t_2[t/x], \cdots, t_n[t/x])$$
, for an
n-ary function *f* applied to *n* terms t_1, t_2, \cdots, t_n .

Substitutions Formally Defined (cont.)

For a formula A, A[t/x] is defined inductively as follows:

• $P(t_1, t_2, \cdots, t_n)[t/x] = P(t_1[t/x], t_2[t/x], \cdots, t_n[t/x])$, for an *n*-ary predicate *P* applied to *n* terms t_1, t_2, \cdots, t_n ;

•
$$(t_1 = t_2)[t/x] = (t_1[t/x] = t_2[t/x]);$$

• $(\neg B)[t/x] = \neg B[t/x];$

- $(B * C)[t/x] = (B[t/x] * C[t/x]), \text{ where } * \in \{\land, \lor, \rightarrow, \leftrightarrow\};$
- $I[t/x] = \bot;$
- $(\forall xB)[t/x] = (\forall xB);$
- $(\forall yB)[t/x] = (\forall yB[t/x])$, if variable y is not x;
- $(\exists xB)[t/x] = (\exists xB);$
- $(\exists yB)[t/x] = (\exists yB[t/x])$, if variable y is not x;

SSV 2021 25 / 34

Quantifier Rules of Natural Deduction

$$\frac{\Gamma \vdash A[y/x]}{\Gamma \vdash \forall xA} (\forall I) \qquad \frac{\Gamma \vdash \forall xA}{\Gamma \vdash A[t/x]} (\forall E)$$

$$\frac{\Gamma \vdash A[t/x]}{\Gamma \vdash \exists xA} (\exists I) \qquad \frac{\Gamma \vdash \exists xA \quad \Gamma, A[y/x] \vdash B}{\Gamma \vdash B} (\exists E)$$

In the rules above, we assume that all substitutions are admissible and y does not occur free in Γ or A.

Yih-Kuen Tsay (IM.NTU)

First-Order Logic

SSV 2021 26 / 34

A Proof in First-Order ND

Below is a partial proof of the validity of $\forall x(\neg p(x) \lor \neg q(x)) \land \forall x(r(x) \to q(x)) \to \forall x(p(x) \to \neg r(x))$ in *ND*, where γ denotes $\forall x(\neg p(x) \lor \neg q(x)) \land \forall x(r(x) \to q(x))$.

$$\frac{\overline{\gamma, p(y), r(y) \vdash r(y) \rightarrow q(y)}}{\gamma, p(y), r(y) \vdash r(y)} \xrightarrow{(Ax)} (Ax) \\
(\rightarrow E) \\
\frac{\overline{\gamma, p(y), r(y) \vdash q(y)}}{\forall x(\neg p(x) \lor \neg q(x)) \land \forall x(r(x) \rightarrow q(x)), p(y), r(y) \vdash q(y) \land \neg q(y)} (\neg I) \\
\frac{\overline{\forall x(\neg p(x) \lor \neg q(x)) \land \forall x(r(x) \rightarrow q(x)), p(y) \vdash \neg r(y)}}{\forall x(\neg p(x) \lor \neg q(x)) \land \forall x(r(x) \rightarrow q(x)), p(y) \vdash \neg r(y)} (\rightarrow I) \\
\frac{\overline{\forall x(\neg p(x) \lor \neg q(x)) \land \forall x(r(x) \rightarrow q(x)) \vdash p(y) \rightarrow \neg r(y)} (\forall I)}{\forall x(\neg p(x) \lor \neg q(x)) \land \forall x(r(x) \rightarrow q(x)) \vdash \forall x(p(x) \rightarrow \neg r(x))} (\rightarrow I) \\
\frac{\overline{\forall x(\neg p(x) \lor \neg q(x)) \land \forall x(r(x) \rightarrow q(x)) \vdash \forall x(p(x) \rightarrow \neg r(x))}} (\rightarrow I) \\$$

Yih-Kuen Tsay (IM.NTU)

SSV 2021 27 / 34

(日) (同) (三) (三) (三) (○)

Let t, t_1, t_2 be arbitrary terms; again, assume all substitutions are admissible.

$$\frac{\Gamma \vdash t = t}{\Gamma \vdash t = t} (= I) \qquad \frac{\Gamma \vdash t_1 = t_2 \quad \Gamma \vdash A[t_1/x]}{\Gamma \vdash A[t_2/x]} (= E)$$

Note: The = sign is part of the object language, not a meta symbol.

Soundness and Completeness

Let System ND also include the quantifier rules.

Theorem

System ND is sound, i.e., if a sequent $\Gamma \vdash C$ is provable in ND, then $\Gamma \vdash C$ is valid.

Theorem

System ND is complete, i.e., if a sequent $\Gamma \vdash C$ is valid, then $\Gamma \vdash C$ is provable in ND.

Note: assume no equality in the logic language.

Yih-Kuen Tsay (IM.NTU)

First-Order Logic

SSV 2021 29 / 34

Compactness

Theorem

For any (possibly infinite) set Γ of formulae, if every finite non-empty subset of Γ is satisfiable then Γ is satisfiable.

Yih-Kuen Tsay (IM.NTU)

First-Order Logic

Consistency

Recall that a set Γ of formulae is *consistent* if there exists some formula *B* such that the sequent $\Gamma \vdash B$ is not provable. Otherwise, Γ is *inconsistent*.

Lemma

For System ND, a set Γ of formulae is inconsistent if and only if there is some formula A such that both $\Gamma \vdash A$ and $\Gamma \vdash \neg A$ are provable.

Theorem

For System ND, a set Γ of formulae is satisfiable if and only if Γ is consistent.

First-Order Logic

SSV 2021 31 / 34

Theory

- 😚 Assume a fixed first-order language.
- \bigcirc A set S of sentences is closed under provability if

 $S = \{A \mid A \text{ is a sentence and } S \vdash A \text{ is provable}\}.$

- A set of sentences is called a *theory* if it is closed under provability.
- A theory is typically represented by a smaller set of sentences, called its axioms.

Group as a First-Order Theory

- The set of non-logical symbols is {·, e}, where · is a binary function (operation) and e is a constant (the identity).
- 📀 Axioms:

- \bigcirc (Z, {+,0}) and (Q \ {0}, {×,1}) are models of the theory.
- 📀 Additional axiom for Abelian groups:

$$\forall a, b(a \cdot b = b \cdot a)$$
 (Commutativity)

Theorems

- A theorem is just a statement (sentence) in a theory (a set of sentences).
- For example, the following are theorems in Group theory:

$$> \forall a \forall b \forall c ((a \cdot b = a \cdot c) \rightarrow b = c).$$

∀a∀b∀c(((a⋅b = e) ∧ (b⋅a = e) ∧ (a⋅c = e) ∧ (c⋅a = e)) → b = c),
 which says that every element has a unique inverse.
