# Introduction

UNITY was once quite popular. Its logic has been modified and improved in a subsequent work.

J. Misra. A logic for concurrent programming. Journal of Computer and Software Engineering, 3(2): 239-272, 1995.

- A program consists of (1) an initial condition and (2) a set of actions (or conditional multiple-assignments), which always includes *skip*.
- 😚 Properties are defined in terms of
  - initially p,
  - 🏓 p **co** q, and
    - *p* transient.

# **Program Model: Action System**

#### 📀 Syntax: An action system consists of

- a set of variables and
- a set of actions, always including skip (which does not change the system's state).

A particular valuation of the variables is called a system or program *state*. An action is essentially a *guarded multiple assignment* to the variables.

- Semantics:
  - A system execution starts from some initial state and goes on forever.
  - In each step of an execution, some action is selected (under some fairness constraint) and executed, resulting in a possible change of the program state.

Yih-Kuen Tsay (IM.NTU)

# The "Contrains" Operator

- The safety properties of a system are stated using the "contrains" ( co ) operator.
- "p co q" (p constrains q) states that whenever p holds, q holds after the execution of any single action.
- Formally,  $p \operatorname{co} q$  in  $F \stackrel{\Delta}{=} \langle \forall t : t \text{ in } F : \{p\} t \{q\} \rangle$ .
- S As skip may be applied in any state, from p co q it follows that p ⇒ q.
- It also follows that once p holds, q continues to hold upto (and including) the point where p ceases to hold (if it ever does).

# Usages of the co

- "x = 0 **co**  $x \ge 0$ ": once x becomes 0 it remains 0 until it becomes positive.
- " $\forall m :: x = m$  co  $x \ge m$ ": x never decreases. This is equivalent to " $\forall m :: x \ge m$  co  $x \ge m$ ".
- " $\forall m, n :: x, y = m, n$  co  $x = m \lor y = n$ ": x and y never change simultaneously.

イロト イポト イヨト イヨト 二日

## The unless Operator

"p unless q" was introduced in the original UNITY logic as a basic safety property:

$$p \text{ unless } q \text{ in } F \stackrel{\Delta}{=} \forall t : t \text{ in } F : \{p \land \neg q\} \ t \ \{p \lor q\}$$

If p is *true* at some point of computation, then it will continue to hold as long as q does not (q may never hold and p continues to hold forever).

Second Example: " $x \ge k$  unless x > k" says that x is non-decreasing.

**?** 
$$p$$
 unless  $q \equiv p \land \neg q$  **co**  $p \lor q$ .

$$igstarrow$$
 p  $\mathbf{co}$  q  $\equiv$  p unless  $eg p \land q$ .

10/20

# The Substitution Axiom

An invariant may be replaced by *true*, and vice versa, in any property of a program.

 $\ref{eq: bound for the second stress}$  Example 1: given p conclude invariant, we conclude

$$p \wedge J$$
 co  $q$ ,  $p$  co  $q \wedge J$ ,  $p \wedge J$  co  $q \wedge J$ , etc.

$$\frac{p \text{ unless } q, \neg q \text{ invariant}}{p \text{ stable}}$$

Note: there is a distinction between an invariant (of a particular program) and a valid formula (in any context). However, as part of a program property, they can be safely interchanged.

Yih-Kuen Tsay (IM.NTU)

SSV 2023 11/20

# **An Elimination Theorem**

- Free variables may be eliminated by taking conjunctions or disjunctions.
- Suppose p a property that does not name any program variable other than x.
- Then, p[x := m] does not contain any variable and is a constant (and hence stable).
- Observe that  $p = \langle \exists m : p[x := m] : x = m \rangle$ .
- An elimination theorem:

x = m co q, where m is free

p does not name m nor any program variable other than x

$$p$$
 co  $\langle \exists m :: p[x := m] \land q \rangle$ 

Yih-Kuen Tsay (IM.NTU)

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ののの

**Transient Predicate (under Weak Fairness)** 

- Under weak fairness, it is sufficient to have a single action falsify a transient predicate.
- $\ \, \bullet \ \, p \ \, {\rm transient} \stackrel{\Delta}{=} \langle \exists s :: \{p\} \ \, s \ \{\neg p\} \rangle$ 
  - Some derived rules:

 $(p \text{ stable } \land p \text{ transient}) \equiv \neg p$ 

(The only predicate that is both stable and transient is *false*.)

 $\frac{p \quad \text{transient}}{p \land q \quad \text{transient}}$ 

Yih-Kuen Tsay (IM.NTU)

UNITY Logic

◆□ ▶ ◆母 ▶ ◆ ■ ▶ ◆ ■ ・ の Q C SSV 2023 14/20

#### **Progress Properties**

• *p* ensures  $q \triangleq (p \land \neg q \text{ co } p \lor q)$  and  $p \land \neg q$  transient. If *p* holds at any point, it will continue to hold as long as *q* does not hold; eventually *q* holds.

• " $p \mapsto q$ " specifies that if p holds at any point then q holds or will eventually hold. Inductive definition:

$$(\text{transitivity}) \quad \frac{p \text{ ensures } q}{p \mapsto q}$$
$$(\text{transitivity}) \quad \frac{p \mapsto q, q \mapsto r}{p \mapsto r}$$
$$(\text{disjunction}) \quad \frac{\langle \forall m : m \in W : p(m) \mapsto q \rangle}{\langle \exists m : m \in W : p(m) \rangle \mapsto q}$$

Example: " $x \ge k \mapsto x > k$ " says that x will eventually increase.

Yih-Kuen Tsay (IM.NTU)

# Some Derived Rules for Progress

(Progress-Safety-Progress, PSP)

$$p\mapsto q, r \ \mathbf{Co} \ s \ (p\wedge r)\mapsto (q\wedge s)\vee (\neg r\wedge s)$$

📀 (well-founded induction)

$$\frac{\langle \forall m :: p \land M = m \mapsto (p \land M < m) \lor q \rangle}{p \mapsto q}$$

Yih-Kuen Tsay (IM.NTU)

UNITY Logic

SSV 2023 16 / 20

イロト 不得 トイラト イラト 一日

#### Notation: F [] G (the union of F and G)

Semantics:

The set of variables is the union of the two sets of variables.

- The set of actions is the *union* of the two sets of actions.
- The composed system is executed as a single system.

< □ > < □ > < □ > < □ > < □ > < □ >

😚 "**co**" enjoys the complete rule of consequence.

- Rules of conjunction and disjunction also hold.
- Stronger rule of parallel composition:

$$\frac{p \operatorname{\mathbf{co}} q \operatorname{in} F, \ p \operatorname{\mathbf{co}} q \operatorname{in} G}{p \operatorname{\mathbf{co}} q \operatorname{in} F \parallel G}$$

But, "**co**" is much less convenient for sequential composition.

Yih-Kuen Tsay (IM.NTU)

UNITY Logic

SSV 2023 18 / 20

# **Union Theorems**

<b>?</b>	$\begin{array}{c c} p \text{ unless } q \text{ in } F, p \text{ stable in } G \\ \hline p \text{ unless } q \text{ in } F \parallel G \end{array}$
	$\begin{array}{c} p \text{ invariant in } F, p \text{ stable in } G \\ \hline p \text{ invariant in } F \parallel G \end{array}$
<b>?</b>	p ensures q in F, p stable in G p ensures q in F [] G

If any of the following properties holds in F, where p is a local predicate of F, then it also holds in F [] G for any G:
 p unless q, p ensures q, p invariant.

Note: Any invariant used in applying the substitution axiom to deduce a property of one module should be proved an invariant in the other module.
