Theory of Computing 2015

Time Complexity

- Decidability of a problem merely indicates that the problem is computationally solvable *in principle*.
- It may not be solvable in practice if the solution requires an inordinate amount of time or memory.
- We shall introduce a way of measuring the time used to solve a problem.
- We then show how to classify problems according to the amount of time required.

- 4 同 6 4 日 6 4 日 6

Measuring Time Complexity

- Let $A = \{0^k 1^k \mid k \ge 0\}.$
- How much time does a single-tape TM need to decide A?
- A single-tape TM M_1 for A works as follows:
 - 1. Scan across the tape and *reject* if a 0 appears to the right of a 1.
 - 2. Repeat Stage 3 if both 0s and 1s remain on the tape.
 - 3. Scan across the tape, crossing off a single 0 and a single 1.
 - 4. If no 0s or 1s remain on the tape, accept; otherwise, reject.

3 / 68

イロン イボン イヨン イヨン 三日

Measuring Time Complexity (cont.)

We shall compute the running time of an algorithm purely as a function of the length of the string representing the input.

Definition (7.1)

Let *M* be a deterministic TM that halts on all inputs. The **running time** or **time complexity** of *M* is the function $f : \mathcal{N} \longrightarrow \mathcal{N}$, where f(n) is the *maximum* number of steps that *M* uses on any input of length *n*. If f(n) is the running time of *M*, we say that *M* runs in time f(n) or that *M* is an f(n) time Turing machine.

イロト 不得下 イヨト イヨト 二日

Asymptotic Analysis

- The exact running time of an algorithm is a complex expression.
- We seek to understand the running time of the algorithm when it is run on large inputs.
- We do so by considering only the highest-order term of the expression of its running time (discarding the coefficient of that term and any lower-order terms).
- For example, if $f(n) = 6n^3 + 2n^2 + 20n + 45$, we say that f is asymptotically at most n^3 .
- The asymptotic notation, or big-O notation, for describing this relationship is $f(n) = O(n^3)$.

Asymptotic Bounds

😚 Let \mathcal{R}^+ be the set of positive real numbers.

Definition (7.2)

Let f and g be two functions $f, g : \mathcal{N} \longrightarrow \mathcal{R}^+$. We say that f(n) = O(g(n)) if positive integers c and n_0 exist so that, for every integer $n \ge n_0$,

 $f(n) \leq cg(n).$

When f(n) = O(g(n)), we say that g(n) is an (asymptotic) upper bound for f(n).

Yih-Kuen Tsay (IM.NTU)

Time Complexity and NP-Completeness

Asymptotic Bounds (cont.)

- Intuitively, f(n) = O(g(n)) means that f is less than or equal to g if we disregard differences up to a constant factor.
- Big-O notation gives a way to say that one function is asymptotically no more than another.
- Big-O notation can appear in arithmetic expressions such as $O(n^2) + O(n) \ (= O(n^2))$ and $2^{O(n)}$.
- Sounds of the form n^c , for c > 0, are called *polynomial bounds*.
- Sounds of the form 2^{n^c} , for c > 0, are called *exponential bounds*.

Asymptotic Bounds (cont.)

To say that one function is asymptotically *less than* another, we use small-o notation.

Definition (7.5)

Let f and g be two functions $f, g : \mathcal{N} \longrightarrow \mathcal{R}^+$. We say that f(n) = o(g(n)) if

$$\lim_{n\to\infty}\frac{f(n)}{g(n)}=0.$$

• For example, $\sqrt{n} = o(n)$ and $n \log n = o(n^2)$.

Yih-Kuen Tsay (IM.NTU)

Time Complexity and NP-Completeness

Theory of Computing 2015

Analyzing Algorithms

- Source Consider the single-tape TM M_1 for deciding $\{0^k 1^k \mid k \ge 0\}$.
- Stage 1 takes $2n \ (= O(n))$ steps: *n* steps to scan the input and another *n* steps to reposition the head at the left-hand end of the tape.
- Each execution of Stage 3 takes 2n steps and at most n/2 such executions are required. So, Stages 2 and 3 take at most (n/2)2n (= O(n²)) steps.
- Stage 4 takes n (= O(n)) steps.

Complexity Classes

Definition (7.7)

Let $t : \mathcal{N} \longrightarrow \mathcal{N}$ be a function. Define the **time complexity class** TIME(t(n)) to be $\{L \mid L \text{ is a language decided by an } O(t(n)) \text{ time Turing machine}\}.$

- Is there a machine that decides A asymptotically faster?
- In other words, is A in TIME(t(n)) for $t(n) = o(n^2)$?

Yih-Kuen Tsay (IM.NTU)

Complexity Classes (cont.)

11 / 68

Below is a faster single-tape TM for deciding A $(= \{0^k 1^k \mid k \ge 0\}).$

- $M_2 =$ "On input string w:
 - 1. Same as Stage 1 of M_1 .
 - 2. Repeat Stages 3 and 4 if both 0s and 1s remain on the tape.
 - 3. If the total number of 0s and 1s remaining is odd, *reject*.
 - 4. Cross off every other 0 and then every other 1.
 - 5. If no 0s or 1s remain on the tape, accept; otherwise, reject."
- The running time of M_2 is $O(n \log n)$ and hence $A \in \text{TIME}(n \log n)$.

Yih-Kuen Tsay (IM.NTU)

イロト 不得 トイヨト イヨト 二日

Complexity Classes (cont.)

12 / 68

- Below is an even faster TM, which has two tapes, for deciding A (= {0^k1^k | k ≥ 0}).
- 📀 $M_3 =$ "On input string w:
 - 1. Same as Stage 1 of M_1 .
 - 2. Copy the 0s on Tape 1 onto Tape 2.
 - 3. Scan across the 1s on Tape 1 until the end of the input, crossing off a 0 on Tape 2 for each 1. If there are not enough 0s, *reject*.
 - If all the 0s have now been crossed off, *accept*; otherwise, *reject*."
- The running time of M_3 is O(n).
- This indicates that the complexity of A depends on the model of computation selected.

Yih-Kuen Tsay (IM.NTU)

Time Complexity and NP-Completeness Theory of Computing 2015

Complexity Relationships among Models

Theorem (7.8)

Let t(n) be a function, where $t(n) \ge n$. Then every t(n) time multitape Turing machine has an equivalent $O(t^2(n))$ time single-tape Turing machine.

- Let M be a k-tape TM running in t(n) time.
- A single-tape TM S simulating M requires O(t(n)) tape cells to store the current contents of M's tapes and the respective head positions.
- It takes O(t(n)) time for S to simulate each of M's t(n) steps.
- 📀 So, the running time of S is $t(n) imes O(t(n)) = O(t^2(n)).$

Yih-Kuen Tsay (IM.NTU)

Complexity Relationships among Models (cont.)

Definition (7.9)

The running time of a nondeterministic TM N is the function $f : \mathcal{N} \longrightarrow \mathcal{N}$, where f(n) is the *maximum* number of steps that N uses on *any* branch of its computation on any input of length n.

Theorem (7.11)

Let t(n) be a function, where $t(n) \ge n$. Then every t(n) time nondeterministic single-tape Turing machine has an equivalent $2^{O(t(n))}$ time deterministic single-tape Turing machine.

A B M A B M

Complexity Relationships among Models (cont.)

- Every branch of N's computation tree has a length of at most t(n).
- The total number of nodes in the tree is O(b^{t(n)}), where b is the maximum number of legal choices given by N's transition function.
- The running time of a simulating deterministic 3-tape TM is $O(t(n)) \times O(b^{t(n)}) = 2^{O(t(n))}$.
- The running time of a simulating deterministic single-tape TM is $(2^{O(t(n))})^2 = 2^{O(2t(n))} = 2^{O(t(n))}$.

Polynomial Time

- For our purposes, polynomial differences in running time are considered to be small, whereas exponential differences are considered to be large.
- Exponential time algorithms typically arise when we solve problems by searching through a space of solutions, called *brute-force search*.
- All "reasonable" deterministic computational models are polynomially equivalent, i.e., any one of them can simulate another with a polynomial increase in running time.
- We shall focus on aspects of time complexity theory that are unaffected by polynomial differences in running time.

Yih-Kuen Tsay (IM.NTU)

イロト イポト イヨト イヨト 二日

The Class P

18 / 68

Definition (7.12)

P is the class of languages that are decidable in *polynomial* time on a *deterministic* single-tape Turing machine. In other words,

$$\mathsf{P} = \bigcup_k \mathrm{TIME}(n^k)$$

P is invariant for all models of computing that are polynomially equivalent to the deterministic single-tape Turing machine.

P roughly corresponds to the class of problems that are "realistically solvable" on a computer.

Yih-Kuen Tsay (IM.NTU)

Time Complexity and NP-Completeness Theory of Computing 2015

Analyzing Algorithms for P Problems

- Suppose that we have given a high-level description of a polynomial time algorithm with stages. To analyze the algorithm,
 - 1. we first give a polynomial upper bound on the number of stages that the algorithm uses, and
 - 2. we then show that the individual stages can be implemented in polynomial time on a reasonable deterministic model.
- A "reasonable" encoding method for problems should be used, which allows for polynomial time encoding and decoding of objects into natural internal representation or into other reasonable encodings.

イロト 不得下 イヨト イヨト 二日

Problems in P

• $PATH = \{ \langle G, s, t \rangle \mid G \text{ is a directed graph that has a directed path from s to } t \}.$

Theorem (7.14)

 $PATH \in P$.

• $M = \text{``On input } \langle G, s, t \rangle$:

- 1. Place a mark on node s.
- 2. Repeat Stage 3 until no additional nodes are marked.
- 3. Scan all the edges of G. If an edge (a, b) is found going from a marked node a to an unmarked node b, mark node b.
- 4. If t is marked, accept; otherwise, reject."

Yih-Kuen Tsay (IM.NTU)

Problems in P (cont.)

• RELPRIME = { $\langle x, y \rangle \mid x$ and y are relatively prime}.

Theorem (7.15)

 $RELPRIME \in P.$

- The input size of a number x is log x (not x itself).
- E = "On input $\langle x, y \rangle$:
 - 1. Repeat Stages 2 and 3 until y = 0.
 - 2. Assign $x \leftarrow x \mod y$.
 - 3. Exchange x and y.
 - 4. Output *x*."
- R = "On input $\langle x, y \rangle$:
 - 1. Run *E* on $\langle x, y \rangle$.
 - 2. If E's output is 1, accept; otherwise, reject."

Yih-Kuen Tsay (IM.NTU)

Problems in P (cont.)

23 / 68

Theorem (7.16)

Every context-free language belongs to P.

We assume that a CFG in Chomsky normal form is given for the context-free language.

D = "On input $w = w_1 w_2 \cdots w_n$,

```
1.
    If w = \varepsilon and S \to \varepsilon is a rule, accept.
2.
    For i = 1 to n.
3.
   For each variable A.
4.
        Is A \rightarrow b, where b = w_i, a rule?
5.
        If yes, add A to table(i, i).
6.
    For l = 2 to n.
7.
      For i = 1 to n - l + 1,
8. Let i = i + l - 1,
9. For k = i to i - 1,
          For each rule A \rightarrow BC.
10.
11.
             If B \in table(i, k) and C \in table(k + 1, i),
             then put A in table(i, j).
12. If S \in table(1, n), accept; otherwise, reject."
```

The Hamiltonian Path Problem

- A Hamiltonian path in a directed graph is a directed path that goes through each node exactly once.
- HAMPATH = { $\langle G, s, t \rangle | G$ is a directed graph with a Hamiltonian path from s to t}.
- We can easily obtain an exponential time algorithm for HAMPATH.
- No one knows whether HAMPATH is solvable in polynomial time.
- However, verifying the existence of a Hamiltonian path may be much easier than determining its existence.

NP-Completeness

Definition (7.34)

A language B is **NP-complete** if it satisfies two conditions:

- 1. B is in NP. and
- 2. every A in NP is polynomial time reducible to B (in which case, we say that B is NP-hard).

Theorem (7.35)

If B is NP-complete and $B \in P$, then P = NP.

Theorem (7.36)

If B is NP-complete and $B \leq_{\rm P} C$ for some $C \in {\rm NP}$, then C is NP-complete.

Yih-Kuen Tsay (IM.NTU)

Time Complexity and NP-Completeness

Theory of Computing 2015

The Cook-Levin Theorem

Theorem (7.37)

SAT is NP-complete.

- SAT is in NP, as a nondeterministic polynomial time TM can guess an assignment to a given formula ϕ and accept if the assignment satisfies ϕ .
- We next construct a polynomial time reduction for each language A in NP to SAT.
- The reduction takes a string w and produces a Boolean formula ϕ that simulates the NP machine N for A on input w.
- Assume that N runs in time n^k (with some constant difference) for some k > 0.

Another NP-Complete Problem

Theorem

3SAT is NP-complete.

- The proof of the Cook-Levin theorem can be modified so that the Boolean formula involved is in conjunctive normal form.
- A CNF-formula can be converted in polynomial time to a 3CNF-formula (with a length polynomially bounded in the length of the CNF-formula).
- If a clause contains *I* literals ($a_1 \lor a_2 \lor \cdots \lor a_l$), we can replace it with the *I* − 2 clauses

$$(a_1 \lor a_2 \lor z_1) \land (\overline{z_1} \lor a_3 \lor z_2) \land (\overline{z_2} \lor a_4 \lor z_3) \land \\ \cdots \land (\overline{z_{l-4}} \lor a_{l-2} \lor z_{l-3}) \land (\overline{z_{l-3}} \lor a_{l-1} \lor a_l)$$
