#### Decidability/Solvability

- We shall demonstrate certain problems that can be solved algorithmically and others that cannot.
- Our objective is to explore the limits of algorithmic solvability.
- Why should you study unsolvability?
  - Knowing when a problem is algorithmically unsolvable is useful because then you realize that the problem must be simplified or altered before you can find an algorithmic solution.
  - A glimpse of the unsolvable can stimulate your imagination and help you gain an important perspective on computation.

#### **Decidable Languages/Problems**

- $A_{\text{DFA}} = \{ \langle B, w \rangle \mid B \text{ is a DFA that accepts } w \}.$
- This is the acceptance problem (membership problem) for DFAs formulated as a language.

Theorem (4.1)

 $A_{\rm DFA}$  is a decidable language.

- $M = \text{``On input } \langle B, w \rangle$ , where B is a DFA and w is a string:
  - 1. Simulate *B* on input *w*.
  - If the simulation ends in an accept state, *accept*; otherwise, *reject*."

Yih-Kuen Tsay (IM.NTU)

• 
$$A_{\text{NFA}} = \{ \langle B, w \rangle \mid B \text{ is an NFA that accepts } w \}.$$

Theorem (4.2)

 $A_{\rm NFA}$  is a decidable language.

•  $N = "On input \langle B, w \rangle$ , where B is an NFA and w is a string:

- 1. Convert NFA B to an equivalent DFA C.
- 2. Run TM *M* for deciding  $A_{\text{DFA}}$  (as a "procedure") on input  $\langle C, w \rangle$ .
- 3. If *M* accepts, *accept*; otherwise, *reject*."

Yih-Kuen Tsay (IM.NTU)

イロト 不得 トイヨト イヨト 二日

•  $A_{\text{REX}} = \{ \langle R, w \rangle \mid R \text{ is a regular expression that generates } w \}.$ 

Theorem (4.3)

 $A_{\rm REX}$  is a decidable language.

• P = "On input  $\langle R, w \rangle$ , where R is a regular expression and w is a string:

- 1. Convert regular expression R to an equivalent DFA A.
- 2. Run TM *M* for deciding  $A_{\text{DFA}}$  on input  $\langle A, w \rangle$ .
- 3. If *M* accepts, *accept*; otherwise, *reject*."

Yih-Kuen Tsay (IM.NTU)

Decidability

• 
$$E_{\text{DFA}} = \{ \langle A \rangle \mid A \text{ is a DFA and } L(A) = \emptyset \}.$$

Theorem (4.4)

 $E_{\rm DFA}$  is a decidable language.

• T = "On input  $\langle A \rangle$ , where A is a DFA:

- 1. Mark the start state of A.
- 2. Repeat Step 3 until no new states get marked.
- 3. Mark any state that has a transition coming into it from any state that is already marked.
- 4. If no accept state is marked, accept; otherwise, reject."

Yih-Kuen Tsay (IM.NTU)

Decidability

Theory of Computing 2018 6 / 27

• 
$$EQ_{DFA} = \{ \langle A, B \rangle \mid A \text{ and } B \text{ are DFAs and } L(A) = L(B) \}.$$

Theorem (4.5)

 $EQ_{\rm DFA}$  is a decidable language.

• F = "On input  $\langle A, B \rangle$ , where A and B are DFAs:

- 1. Construct DFA  $C = (A \cap \overline{B}) \cup (\overline{A} \cap B)$ .
- 2. Run TM T for deciding  $E_{\text{DFA}}$  on input  $\langle C \rangle$ .
- 3. If T accepts, accept; otherwise, reject."

#### **Decidable CFL Properties**

• 
$$A_{CFG} = \{ \langle G, w \rangle \mid G \text{ is a CFG that generates } w \}.$$

Theorem (4.7)

 $A_{\rm CFG}$  is a decidable language.

• S = "On input  $\langle G, w \rangle$ , where G is a CFG and w is a string:

- 1. Convert G to an equivalent grammar in Chomsky normal form.
- 2. List all derivations with 2|w| 1 steps.
- If any of these derivations generate w, accept; otherwise, reject."

Yih-Kuen Tsay (IM.NTU)

イロト 不得下 イヨト イヨト 二日

#### Decidable CFL Properties (cont.)

• 
$$E_{CFG} = \{ \langle G \rangle \mid G \text{ is a CFG and } L(G) = \emptyset \}.$$

Theorem (4.8)

 $E_{\rm CFG}$  is a decidable language.

• R = "On input  $\langle G \rangle$ , where G is a CFG:

- 1. Mark all terminals in G.
- 2. Repeat Step 3 until no new variables get marked.
- 3. Mark any variable A where  $A \rightarrow U_1 U_2 \cdots U_k$  is a rule in G and each symbol  $U_1, U_2, \cdots, U_k$  has already been marked.
- 4. If the start symbol is not marked, accept; otherwise, reject."

Yih-Kuen Tsay (IM.NTU)

Decidability

#### **Decidability of CFLs**

#### Theorem (4.9)

Every context-free language is decidable.

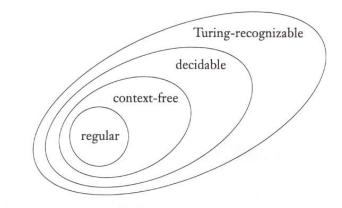

- Let G be a CFG for the given language A and design a TM  $M_G$  that decides A.
- 📀  $M_G =$  "On input w:
  - 1. Run TM S for deciding  $A_{CFG}$  on input  $\langle G, w \rangle$ .
  - 2. If S accepts, accept; otherwise, reject."

Yih-Kuen Tsay (IM.NTU)

Decidability

#### **Classes of Languages**

#### FIGURE 4.10

The relationship among classes of languages

3

(人間) トイヨト イヨト

#### Classes of Languages (cont.)

Chomsky	Grammar	Language	Computation
Hierarchy			Model
Type-0	Unrestricted	R.E.	Turing Machine
N/A	(no common name)	Recursive	Decider
Type-1	Context-Sensitive	Context-Sensitive	Linear Bounded
Type-2	Context-Free	Context-Free	Pushdown
Type-3	Regular	Regular	Finite

- Recall that Recursively Enumerable (R.E.) = Turing-recognizable and Recursive = Decidable (Turing-decidable).
- Linear Bounded Automata will be introduced later.

Yih-Kuen Tsay (IM.NTU)

Decidability

Theory of Computing 2018 13 / 27

#### Undecidability

- We shall prove that there is a specific problem that is algorithmically unsolvable.
- This result demonstrates that computers are limited in a very fundamental way.
- Unsolvable problems are not necessarily esoteric. Some ordinary problems that people want to solve may turn out to be unsolvable.
- For example, the general problem of software verification is not solvable by computer.
- The specific problem that we will prove algorithmically unsolvable is the one of testing whether a Turing machine accepts a given input string.

イロト 不得下 イヨト イヨト 二日

#### **The Acceptance Problem**

#### • $A_{\text{TM}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ accepts } w \}.$

Theorem (4.11)

 $A_{\rm TM}$  is undecidable.

- 😚 We will prove this fundamental result later.
- $\bigcirc$  On the other hand,  $A_{\mathrm{TM}}$  is Turing-recognizable.

#### The Acceptance Problem (cont.)

•  $U = \text{``On input } \langle M, w \rangle$ , where M is a TM and w is a string:

- 1. Simulate M on input w.
- If *M* ever enters its accept state, *accept*; if *M* ever enters its reject state, *reject*."
- If we had (actually not) some way to determine that M was not halting on w, then we could turn the recognizer U into a decider.

Note: The Turing machine U is an example of the *universal Turing machine*, as it is capable of simulating any other Turing machine from the description of that machin. The universal Turing machine inspired "stored-program" computers.

### **Countable vs. Uncountable Sets**

### Definition (4.12)

- Let f be a function from A to B.
  - We say that f is one-to-one if  $f(a) \neq f(b)$  whenever  $a \neq b$ .
  - Say that f is onto if, for every  $b \in B$ , there is an  $a \in A$  such that f(a) = b.
  - A function that is both one-to-one and onto is called a correspondence.
  - Two sets are considered to have the same size if there is a correspondence between them.

#### Definition (4.14)

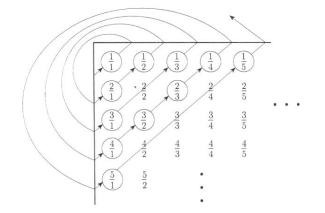

A set A is **countable** if either it is finite or it has the same size as  $\mathcal{N} = \{1, 2, 3, \dots\}$ ; it is **uncountable**, otherwise.

Yih-Kuen Tsay (IM.NTU)

Decidability

3

- A real number is one that has a (possibly infinite) decimal representation.
  - $\ref{eq: 1.1}$  Let  $\mathcal R$  be the set of real numbers.

## Theorem (4.17)

 ${\mathcal R}$  is uncountable.

3

#### Uncountable Sets (cont.)

Assume that a correspondence f existed between  $\mathcal{N}$  and  $\mathcal{R}$ .

n	f(n)
1	3. <u>1</u> 4159 · · ·
2	55.5 <u>5</u> 555 · · ·
3	0.12 <u>3</u> 45 · · ·
4	0.500 <u>0</u> 0 · · ·
÷	:

- We can find an x, 0 < x < 1, so that the *i*-th digit following the decimal point of x is different from that of f(i); for example, x = 0.4641... is a possible choice.
- This proof technique is called *diagonalization*, discovered by Georg Cantor in 1873.

Yih-Kuen Tsay (IM.NTU)

### Unrecognizability

### Corollary (4.18)

Some languages are not Turing-recognizable.

- The set of all Turing machines is countable because each Turing machine *M* has an encoding into a string (*M*).
- $\bigcirc$  Let  $\mathcal L$  be the set of all languages over alphabet  $\Sigma$ .
- We can show that there is a correspondence between  $\mathcal{L}$  and the uncountable set  $\mathcal{B}$  of all infinite binary sequences.

$$\stackrel{\text{\tiny{\bullet}}}{=} \text{Let } \Sigma^* = \{s_1, s_2, s_3, \cdots\}.$$

Each language A ∈ L has a unique sequence in B, where the *i*-th bit is a 1 if and only if s<sub>i</sub> ∈ A.

Yih-Kuen Tsay (IM.NTU)

#### Undecidability of the Acceptance Problem

igstarrow Suppose H is a decider for  $A_{
m TM}$ :

$$H(\langle M, w \rangle) = \begin{cases} accept & \text{if } M \text{ accepts } w \\ reject & \text{if } M \text{ does not accept } w \end{cases}$$

Solution 
$$D =$$
 "On input  $\langle M \rangle$ , where  $M$  is a TM:

1. Run *H* on input  $\langle M, \langle M \rangle \rangle$ .

2. If *H* accepts, *reject* and if *H* rejects, *accept*."

• When D takes itself, namely  $\langle D \rangle$ , as input:

$$D(\langle D \rangle) = \begin{cases} accept & \text{if } D \text{ does not accept } \langle D \rangle \\ reject & \text{if } D \text{ accepts } \langle D \rangle \end{cases}$$

### A Turing-Unrecognizable Language

A language is co-Turing-recognizable if it is the complement of a Turing-recognizable language.

Theorem (4.22)

A language is decidable if and only if it is both Turing-recognizable and co-Turing-recognizable.

- Let  $M_1$  be a recognizer for A and  $M_2$  be a recognizer for  $\overline{A}$ . • M = ``On input w:
  - 1. Run both  $M_1$  and  $M_2$  on input w in parallel. (*M* takes turns simulating one step of each machine until one of them halts.)
  - 2. If  $M_1$  accepts, *accept* and if  $M_2$  accepts, *reject*."

Yih-Kuen Tsay (IM.NTU)

#### A Turing-Unrecognizable Language (cont.)

#### • $\overline{A_{\text{TM}}} = \{ \langle M, w \rangle \mid M \text{ is a TM and } M \text{ does not accept } w \}.$

Corollary (4.23)

 $\overline{A_{\rm TM}}$  is not Turing-recognizable.

Yih-Kuen Tsay (IM.NTU)

Decidability
