The Vertex Cover Problem

A vertex cover of an undirected graph G is a subset of the nodes where every edge of G touches one of those nodes.

VERTEX_COVER = { \langle G, k \rangle | G is an undirected graph that has a k-node vertex cover }.

Theorem

VERTEX_COVER is NP-complete.

The Hamiltonian Path Problem

Theorem

HAMPATH is NP-complete.

We show that $3SAT \leq_{P} HAMPATH$.

Let UHAMPATH be the undirected version of the Hamiltonian path problem HAMPATH.

Theorem

UHAMPATH is NP-complete.

- An input $\langle G, s, t \rangle$ for *HAMPATH* is mapped to $\langle G', s', t' \rangle$ for *UHAMPATH* as follows.
- The Each node u of G, except for s and t, is replaced by a triple of nodes u^{in} , u^{mid} , and u^{out} in G'.
- 😚 Nodes s and t are replaced by node $s^{\mathrm{out}} = s'$ and $t^{\mathrm{in}} = t'.$
- Edges connect u^{mid} with u^{in} and u^{out} .
- An edge connects u^{out} and v^{in} if (u, v) is an edge of G.

The Subset Sum Problem

• SUBSET_SUM = {
$$\langle S, t \rangle | S = \{x_1, \dots, x_k\}$$
 and for some $\{y_1, \dots, y_l\} \subseteq S$, we have $\sum y_i = t$ }.

Theorem

SUBSET_SUM is NP-complete.

• We show that $3SAT \leq_{P} SUBSET_SUM$.
